1 Introduction

2 Horticultural lighting products using LEDs must comply with the provisions of this document to be
3 eligible for listing on the DLC Solid-State Horticultural Lighting Qualified Products List (“Horticultural
4 QPL”, “Hort QPL”). Products eligible for DLC qualification must be complete LED light fixtures or lamps.
5 That is, they must be electromagnetic radiation-generating devices analogous to luminaires (or fixtures)
6 or LED lamps (integrated and non-integrated) as defined by ANSI/IES LS-1-20 sections 6.8.5 and 10.3.1 or
7 6.8.5.3 and 6.8.5.4, respectively.

8 Version 3.0 Draft 1 of the Horticultural Technical Requirements proposes new performance thresholds,
9 introduces required reporting of intended use case information and fixture-level controllability
10 attributes, and introduces a surveillance testing policy to support the advancement of energy efficient
11 lighting in controlled environment agriculture.

12 Definitions

13 Unless otherwise noted, DLC policy nomenclature directly references the definitions from the American
14 Society of Agricultural and Biological Engineers (ASABE) *ANSI/ASABE S640: Quantities and Units of*
15 *Electromagnetic Radiation for Plants (Photosynthetic Organisms)*, and, where applicable, the
16 Illuminating Engineering Society (IES) *ANSI/IES RP-45-21, Recommended Practice: Horticultural Lighting*
17 *and ANSI/IES LS-1-20, Lighting Science: Nomenclature and Definitions for Illuminating Engineering*, with
18 key deviations or interpretations noted. Each mention of the term “LED device” in this document is
19 meant to reference LED packages, modules, or arrays.

20 Eligibility

21 Products designed and intended to operate with standard North American nominal AC line voltages
22 (typically 120V-480V) or with DC voltages below 600V are eligible for DLC qualification. The following are
23 further rules for horticultural lighting equipment.

- 24 • Ineligible products include:
 - 25 ○ Products that are light engines (analogous to LS-1-20 section 6.8.5.5) or identified as
26 retrofit kits intended to replace the light sources or other structures within an existing
27 fixture.
 - 28 ○ Fixtures and/or lamps that incorporate light sources other than LED, whether as sole-
29 source or as LED-hybrid fixtures.
 - 30 ○ Products that are dynamically configurable, i.e., having no defined configuration or set
31 of configurations and whose form factor may vary in the grow facility, are not eligible as
32 an AC product.
- 33 • Manufacturers must list full and complete model numbers that clearly demonstrate all qualified
34 product options offered.

35 ○ “Full and complete model numbers” means model numbers that include all
36 performance-affecting and non-performance-affecting variations offered, and that do
37 not omit any option that is available to customers in the market. In general, options that
38 do not affect the performance of the product may be submitted as a single model
39 number, and the multiple options may be denoted by bracketing them in the model
40 number.

41 For example, a product that has multiple exterior paint color options or mounting
42 options that do not affect performance may include all color and mounting options in
43 brackets (e.g., "[WH, BLK, SLV, GRY]") within a single model number. Low and high
44 voltage options may be submitted as a single model number (e.g., "ABC 300 [120V-277V,
45 347V-480V] WH") with the worst-case performance reported. Multiple driver variations
46 may be included in single product applications, as noted above, and listed in a single
47 model number, as long as they perform nominally the same. If the drivers perform
48 nominally differently – that is, they are not presented to customers as having the same
49 performance other than voltage input and result in different ordering codes – then the
50 unique drivers must be listed in separate model numbers. Options that affect the flux
51 output, presence or lack of dimming capabilities, or spectral tuning options may not be
52 bracketed and submitted as a single model number.

53 ○ DLC reviewers may check web listings and other marketing materials and reserve the
54 right to request additional information to demonstrate the full and complete model
55 number. A lack of clarity in model numbers will result in delayed application processing;
56 misrepresentation of model numbers discovered outside the application process will
57 generally be considered a violation of the DLC program and trademark rules and may
58 result in delisting.

59 ○ Each model number may only represent the fixture/lamp under a single brand. If the
60 fixture/lamp can be sold under multiple brands, model numbers must be listed
61 separately for each brand.

62

63 Testing Methods and Requirements

64 The DLC Technical Requirements for LED-based Horticultural Lighting are as follows. Details explaining
65 each item follow **Table 1**.

66 **Table 1: DLC Horticultural Lighting Technical Requirements**

Parameter/Attribute/Metric	Requirement	Requirement Type	Method of Measurement/Evaluation
Photosynthetic Photon Flux (Φ_p or PPF) ($\mu\text{mol} \times \text{s}^{-1}$)	n/a	Reported	(ANSI/IES LM-79) 400-700nm range, with 400-500nm, 500-600nm, and 600-700nm bins reported alongside the total
Far-Red Photon Flux ($\Phi_{p,fr}$ or PFR) ($\mu\text{mol} \times \text{s}^{-1}$)	n/a	Reported	(ANSI/IES LM-79) 700-800nm range
Photon Flux (PF _{PBAR}) ($\mu\text{mol} \times \text{s}^{-1}$)	n/a	Reported (Optional)	(ANSI/IES LM-79) 280-800nm range
Spectral Quantum Distribution (SQD) ($\mu\text{mol} \times \text{s}^{-1} \times \text{nm}^{-1}$)	n/a	Reported	(ANSI/IES LM-79) (ANSI/IES TM-33-18) 400-800nm range
Photosynthetic Photon Intensity Distribution (I _p or PPID) ($\mu\text{mol} \times \text{s}^{-1} \times \text{sr}^{-1}$)	n/a	Reported	(ANSI/IES LM-79) (ANSI/IES TM-33-18) 400-700nm range
Photosynthetic Photon Efficacy ¹ (K _p or PPE) ($\mu\text{mol} \times \text{J}^{-1}$)	$\geq 2.30 \mu\text{mol} \times \text{J}^{-1}$	Required/ Threshold	(ANSI/IES LM-79) 400-700nm range

¹ DC-powered fixtures must meet the PPE threshold requirement at their AC de-rated PPE value. See “Special Considerations for DC-Powered Fixtures” for more information on AC de-rating.

² Currently, the DLC follows [a prescribed timeline regarding revision cycles and planned efficacy increase](#). The draft PPE listed here follows the prescribed policy.

Parameter/Attribute/Metric	Requirement	Requirement Type	Method of Measurement/Evaluation
Photon Efficacy (PE_{PBAR}) ($\mu\text{mol} \times \text{J}^{-1}$)	n/a	Reported (Optional)	(ANSI/IES LM-79) 280-800nm range
Photon Flux Maintenance, Photosynthetic (PFM_P)	Q ₉₀ ≥36,000 hours	Required/Threshold	(ANSI/IES LM-80 / IES TM-21 or IES LM-84 / IES TM-28) 400-700nm range, fixture specification sheet, and <i>In-Situ Temperature Measurement Test</i> (ISTMT)
Photon Flux Maintenance, Far-Red (PFM_{FR})	Report time to Q ₉₀	Reported	(ANSI/IES LM-80 / IES TM-21 or IES LM-84 / IES TM-28) 700-800nm range
Driver Lifetime	≥50,000 hours	Required/Threshold	Driver specification sheet, fixture specification sheet, and <i>In-Situ Temperature Measurement Test</i> (ISTMT)
Fan Lifetime	≥50,000 hours	Required/Threshold	Fan specification sheet, fixture specification sheet
Warranty	Fixtures: ≥5 years Lamps: ≥3 years	Required/Threshold	Legal warranty terms & conditions
Power Factor (PF)	≥0.9	Required/Threshold	Benchtop electrical testing or ANSI/IES LM-79
Total Harmonic Distortion, Current (THDi)	≤20%	Required/Threshold	Benchtop electrical testing or ANSI/IES LM-79
Safety Certification	Horticultural Lighting designation by OSHA NRTL or SCC-recognized body	Required	ANSI/UL 8800 (ANSI/CAN/UL 8800)

Parameter/Attribute/Metric	Requirement	Requirement Type	Method of Measurement/Evaluation
Application Information	Report controlled environment(s) and lighting scheme(s)	Reported	Product specification sheet
Controllability	Dimming capability required	Required	Driver and/or product specification sheets
	Report dimming range, dimming and control method designations to the product, control attribute(s), and transmission hardware(s)	Reported	Driver and/or product specification sheets

67

68 Output Characteristics

69 The DLC requires testing and reporting of the following characteristics for the output of horticultural
70 lighting devices.

- 71 • **Photosynthetic Photon Flux (Φ_p or PPF), ($\mu\text{mol} \times \text{s}^{-1}$)**

72 This is the total output of the product over the specific range of wavelengths defined by
73 ANSI/ASABE S640 for PPF (400-700nm). This metric is an integrated value for the entire fixture
74 and contains no spectral or directional information.

75 The DLC Horticultural QPL reports on both the total and ~100nm-wide “bins” of flux within this
76 range to allow end users to understand the fixture’s relative proportions. Test information must
77 provide output in these ranges specifically, in addition to the total 400-700nm output.

- 78 • **Far-Red Photon Flux ($\Phi_{p,fr}$ or PF_{FR}), ($\mu\text{mol} \times \text{s}^{-1}$)**

79 This is the output of the product over the “far-red” band defined by ANSI/ASABE S640 (700-
80 800nm). This metric is an integrated value for the entire fixture and contains no spectral or
81 directional information. This metric is reported only and does not have a qualifying threshold.

82 The DLC Horticultural QPL reports on the total flux of this 100nm-wide band separately for end
83 users’ informational needs.

84 • **Photon Flux (PF_{PBAR}), ($\mu\text{mol} \times \text{s}^{-1}$)**
85 This is the output of the product over a plant’s “photobiologically active radiation” (PBAR)
86 wavelength range (280-800nm). This metric is an integrated value for the entire fixture and
87 contains no spectral or directional information. This metric is optionally reported only and does
88 not have a qualifying threshold.

89 The DLC Horticultural QPL reports on the total flux of this PBAR band specifically for end users’
90 informational needs. PF_{PBAR} is intended to convey UV, PAR, and FR radiation, which are often
91 associated with photomorphological effects in plants. PF_{PBAR} is not an ASABE S640 defined term
92 and is not required for DLC qualification, though it can be reported and listed if desired by
93 applicants.

94 • **Photon Efficacy (PE_{PBAR}), ($\mu\text{mol} \times \text{J}^{-1}$)**
95 This is the output of the product over a plant’s “photobiologically active radiation” (PBAR) band
96 (280-800nm) divided by the total electrical input watts to the fixture, including any other
97 ancillary loads (controllers, sensors, cooling fans, etc.) used within the lighting system. This
98 metric is an integrated value for the entire fixture and contains no spectral or directional
99 information. This metric is optionally reported only and does not have a qualifying threshold.

100 The DLC Horticultural QPL reports on the total flux of this PBAR band specifically for end users’
101 informational needs. PE_{PBAR} is intended to convey luminaire efficacy in converting electrical
102 energy into UV, PAR, and FR radiation, which are often associated with photomorphological
103 effects in plants. PE_{PBAR} is not an ASABE S640 defined term and is not required for DLC
104 qualification, though it can be reported and listed if desired by applicants.

105 • **Spectral Quantum Distribution (SQD), ($\mu\text{mol} \times \text{s}^{-1} \times \text{nm}^{-1}$)**
106 This is the distribution of photon flux per photon wavelength over the photosynthetic and far-
107 red range of wavelengths defined by ANSI/ASABE S640 (400-800nm). The DLC will also accept
108 the distribution of photon flux per photon wavelengths over the PBAR range (280-800nm).
109 When reporting either of the optional PBAR metrics (i.e., PF_{PBAR} and PE_{PBAR}), distribution of
110 photon flux over the PBAR range is required. This distribution is measured and reported as
111 integrated in all directions from the fixture and contains no granular directional information
112 itself. This distribution shall be measured and reported from an appropriately accredited facility.

113 An image of this distribution shall be submitted within the application in a .jpg graphical file
114 format, at a size of 300x300 pixels or larger. This image will be accessible to users on the QPL.
115 The DLC intends to utilize the required .xml file per ANSI/IES TM-33- and is planning to release a
116 publicly available tool to generate these images during the Version 2 listing period.

117 For additional information, please refer to the [TM-33-18 Reporting](#) section.

118 • **Photosynthetic Photon Intensity Distribution (I_p or PPID), ($\mu\text{mol} \times \text{s}^{-1} \times \text{sr}^{-1}$)**
119 This is the distribution of photosynthetic photon intensity per unit solid angle leaving the fixture.
120 This distribution is measured and reported as integrated for all wavelengths across the 400-
121 700nm range leaving the fixture and contains no spectral distribution information itself. This
122 distribution must be measured and reported from an appropriately accredited facility.
123 An image of this distribution is to be submitted within the application in a .jpg graphical file
124 format, at a size of 300x300 pixels or larger. This image will be accessible to users on the QPL.

125 The DLC intends to utilize the required .xml file per ANSI/IES TM-33- and is planning release of a
126 publicly available tool to generate these images in the near future, during the Version 2 listing
127 period.

128 For additional information, please refer to the [TM-33-18 Reporting](#) section.

129 Efficacy

130 The DLC requires testing and reporting of the following characteristics for the output of horticultural
131 lighting devices.

- 132 • **Photosynthetic Photon Efficacy (PPE),**

133 This is the output of the fixture over the specific range of wavelengths defined by ANSI/ASABE
134 S640 for PPF (400-700nm), divided by the total electrical input watts to the fixture, including any
135 other ancillary loads (controllers, sensors, cooling fans, etc.) used within the lighting system.

136 All products shall have a PPE of $\geq 2.30 \mu\text{mol} \times \text{J}^{-1}$. In both submitted applications and under surveillance
137 testing, the DLC allows an absolute tolerance of -5% to this threshold value. The result of this is the
138 DLC's acceptance of any test report showing an efficacy of $2.19 \mu\text{mol} \times \text{J}^{-1}$ or higher, and the
139 disqualification of any product, either during submission or surveillance testing, with a test report
140 showing an efficacy less than $2.19 \mu\text{mol} \times \text{J}^{-1}$, at any point in the product's specified operating voltage
141 range. All evaluations and listings of this measurement will be rounded to the nearest hundredth.

142 If a product contains multiple drivers:

- 143 • All driver specification sheets shall be provided.
- 144 • For each unique driver used, manufacturers shall provide electrical testing to document which
145 driver variation results in the overall minimum K_p (PPE) or worst-case driver efficiency, as well as
146 which variation results in the overall worst-case power quality (THDi and PF).
 - 147 ○ This testing shall include the input current and wattage; the output voltage, current, and
148 wattage; and the THDi and PF for each driver, at each nominal input voltage.
 - 149 ○ In-house (i.e., non-accredited lab) benchtop electrical testing is sufficient for
150 demonstrating the driver variation that yields the overall minimum K_p (PPE) and
151 minimum power quality at the applicable loading conditions and at the applicable input
152 voltages.
 - 153 ○ From this electrical characterization testing, the product and conditions representing
154 worst-case efficacy shall undergo formal whole-fixture LM-79 testing by an accredited
155 testing lab.
 - 156 ○ For questions about testing requirements for Level 2 applications (formerly Family
157 Grouping applications), please refer to the [Level 2 \(formerly Family Grouping\)](#)
158 [Application Requirements for LED-based Horticultural Lighting](#).
- 159 • Drivers that result in explicitly different nominal fixture performance (for example, a driver
160 change which results in different flux output by the product, determined at the DLC's discretion)
161 are not permissible variations within a single model number and are required to submit a Level

162 2 application for QPL listing. If alternate driver variations result in different input wattage,
163 worst-case will be published on the QPL.

- 164 ○ Please refer to the [Level 2 \(formerly Family Grouping\) Application Requirements for](#)
165 [LED-based Horticultural Lighting](#) for specific testing and reporting requirements for
166 product families.

167 Long-Term Performance

168 The DLC requires the following performance data to characterize the long-term performance of the
169 fixture:

- 170 • **Flux Maintenance, Φ_p (PPF) and $\Phi_{p,fr}$ (PF_{FR})**

171 This is a characterization of the ability of the device to maintain its output within the given
172 parameters over time. Given that device output of interest is measured in quanta of photons,
173 and not in lumens, the DLC will use the general engineering term for quanta, “Q”, instead of the
174 more-familiar “L” prefix used within general illumination applications.

- 175 ○ The DLC requires either LED device-level or whole-fixture testing and projections in
176 accordance with the (LM-80 and TM-21) or (LM-84 and TM-28) industry standards
177 sufficient for a Q₉₀ of ≥36,000 hours within the Φ_p (PPF) range (400-700nm). The “Q” in
178 the Q₉₀ value is based strictly on the value shown in cell I42 of the ENERGY STAR [TM-21](#)
179 [calculator](#) or cell I45 of the ENERGY STAR [TM-28 calculator](#).
- 180 ○ All TM-21 or TM-28 projections shall be made at the maximum ambient temperature on
181 the fixture’s specification sheet. See [In-Situ Temperature Measurement Testing \(ISTMT\)](#)
182 information below for additional details. All temperature values shall be reported in
183 degrees Celsius.
- 184 ○ The DLC requires testing and projections to report Q₉₀ for the $\Phi_{p,fr}$ (PF_{FR}) range of 700-
185 800nm, but does not make determinations or qualifications based on this data. Please
186 see a description of PFM_{FR}-specific testing requirements in the [For fixtures using](#)
187 [multiple types of LEDs](#) section below.
- 188 ○ To support PFM_p and PFM_{FR} projections, LM-80/LM-84 information shall be provided for
189 both the 400-700nm and the 700-800nm range.
 - 190 ▪ All new product submissions using the LM-80/TM-21 approach shall provide LM-
191 80 data in appropriate (PPF, PF_{FR}) units, measured as such at all time points in
192 the LM-80 procedure. The DLC reserves the right to request additional
193 information for all reports referring to “photon flux” that are ambiguous (based
194 on product SQD) about the division of said flux between the PPF and PF_{FR}
195 categories to determine approval.
 - 196 ▪ Products will not be qualified and listed on the QPL without long-term
197 performance data for flux degradation. Products that use LEDs for which no LM-
198 80 data is available shall undergo LM-84 testing for TM-28 projections.
- 199 ○ *In-Situ Temperature Measurement Testing (ISTMT):*

- 200
- 201
- 202
- 203
- 204
- 205
- 206
- 207
- 208
- 209
- 210
- 211
- 212
- 213
- 214
- 215
- 216
- 217
- 218
- 219
- 220
- 221
- 222
- 223
- 224
- 225
- 226
- 227
- 228
- 229
- 230
- 231
- 232
- 233
- 234
- 235
- 236
- 237
- 238
- 239
- ISTMTs shall be conducted and provided for the hottest LED in the fixture, and LED-device level drive current shall be reported.
 - ISTMTs shall be conducted and reported in the same manner as thermal testing for safety certification. Specifically, applicants shall report the operating temperature of the LED at the fixture’s highest rated ambient temperature within the ISTMT report. This must be done in accordance with acceptable procedures from safety certification standards for measuring and projecting operating temperatures. For example, if a fixture is rated for operation at 40°C ambient, ISTMTs are not accepted if they only show the temperature of the LED when measured during a 25°C ambient condition. In this example, appropriate steps must be taken to characterize the LED operating temperature when the fixture is in a 40°C ambient environment, as defined by the thermal portions of the relevant safety standards.
 - For fixtures using multiple types of LEDs:
 - LM-80 reports (if being used instead of whole-fixture LM-84 data) shall be provided for each type of LED device present in the fixture.
 - For DLC evaluations, LED “type” is differentiated by the nominal output of the LED device or the manufacturer of that LED device. For example, a fixture incorporating four different LEDs, with nominal emissions of 440nm, 660nm, 730nm, and a 5000K “white”, is required to provide four LM-80s and associated information for TM-21 projections, corresponding to each of these nominal designations. Some limited cross-applicability of LM-80 data is allowed within phosphor-converted white LEDs of the same series; see [LM-80 applicability](#) information below.
 - ISTMT testing shall be provided on the hottest of each LED type (for example, the hottest blue, white, and red LED in the fixture, respectively).
 - Maximum LED drive current shall be reported for each LED type.
 - For PFM_P (400-700nm), each LED type present in the fixture that has at least 25% of its per-device flux in the PPF range shall independently meet the Q₉₀ ≥ 36,000 hours requirement, as shown by a TM-21 calculation. The DLC does not require device-level SQD data from applicants and will typically accept the applicant’s descriptions of a device’s relative PPF while reserving the right to request explanation.
 - The DLC requires calculated PFM_{FR} for all fixtures with a PFM_{FR} output that is equal to or greater than 5% of the fixture’s flux from 400-800nm. For PFM_{FR} (700-800nm), each LED type present in the fixture that has at least 25% of its per-device flux in the PFM_{FR} range shall report its Q₉₀ duration in hours. The DLC does not require device-level SQD data from applicants and will typically accept the applicant’s descriptions of a device’s relative PFM_{FR}, while reserving the right to

240 require explanation. There is no threshold performance requirement across this
241 far-red range; it is a reported value only.

- 242 ○ LM-80 applicability:
 - 243 ■ For phosphor-converted “white” LEDs within the ANSI nominal chromaticity
244 range, the DLC follows the [ENERGY STAR Requirements for the Use of LM-80](#)
245 [Data](#) published September 2017. Consistent with the ENERGY STAR
246 requirements, for narrow-band emitters, the DLC generally requires an LM-80
247 for each distinct nominal product (e.g., 650nm, 620nm, 590nm) offered by an
248 LED device manufacturer. Devices of the same type but with different optical
249 codes for beam spread are allowed to cross-apply LM-80 testing. This also
250 applies to products that are in the same series with differences in nomenclature
251 due to marketing changes (see series provisions of ENERGY STAR requirements
252 document). The DLC reserves the right to require additional information to
253 approve all claims of LM-80 applicability.

- 254 ● **Driver ISTMT**

255 Applicants shall supply a technical specification sheet for the driver(s) they use in their product,
256 showing the lifetime of the driver based on operating temperature and the temperature
257 measurement point (TMP) for monitoring the operating temperature of the driver. In-situ
258 temperature measurement testing shall be conducted, and a report shall be provided with the
259 application showing an operating temperature consistent with the driver specification sheet
260 information and demonstrating that the driver will have a lifetime of at least 50,000 hours when
261 operating at or above the highest rated ambient temperature on the fixture’s specification
262 sheet. All temperature values shall be reported in degrees Celsius.

263 As noted in the [ISTMT](#) description within the flux maintenance section, driver ISTMTs shall be
264 conducted and reported in the same manner as thermal testing for safety certification.
265 Specifically, applicants shall report the operating temperature of the driver at the fixture’s
266 highest rated ambient temperature within the ISTMT report. This shall be done in accordance
267 with acceptable procedures from safety certification standards for measuring and projecting
268 operating temperatures. For example, if a fixture is rated for operation at 40°C ambient, ISTMTs
269 are not accepted if they only show the temperature of the driver when measured during a 25°C
270 ambient condition. In this example, appropriate steps must be taken to report the driver
271 operating temperature when the fixture is operating in a 40°C ambient environment, as defined
272 by the thermal portions of the relevant safety standards.

- 273 ○ For products that may use multiple drivers, specification sheets for each driver shall be
274 provided with the details above. Testing shall be conducted on each driver at its
275 appropriate worst-case input voltage. If a product uses multiple drivers from the same
276 manufacturer product line or series, as determined by the DLC, then the single worst-
277 case thermal ambient environment of the product line or series requires a driver ISTMT.
278 Typically, the DLC will operate with the expectation that the operating condition at the
279 highest wattage in the driver manufacturer’s product line or series is the worst-case
280 thermal ambient environment, but the DLC may ask the manufacturer to provide
281 detailed evidence to document the worst-case driver thermals.

282 ▪ Custom and integrated drivers shall provide documentation equivalent to that
283 required for drivers from third-party vendors. Manufacturers shall supply
284 documentation indicating the maximum acceptable temperature for the driver
285 for 50,000-hour life, as well as the TMP to be used during thermal testing and
286 evaluation.

287 • **Fans**

288 Products that employ on-board cooling fans shall provide a technical specification sheet for each
289 fan type employed in the product, family group, or spectral sub-group, as applicable. The fan
290 specification sheet shall state the lifetime of the fan and a reference operating temperature
291 rating for that lifetime claim. The lifetime shall be at least 50,000 hours, at an operating
292 temperature at or above the fixture’s highest rated ambient temperature.

293 If the product is available with multiple fan models:

- 294 ○ If fan model variations result in substantively different component temperature or
295 wattage consumption by the fixture (determined at the DLC’s discretion), a Level 2
296 (formerly Family Grouping) application is required with model numbers to represent the
297 different fan variations. DLC reviewers will examine fan model power levels and flow
298 rate to determine this distinction. Products that offer fan variations without
299 substantively different component temperature or wattage consumption by the fixture
300 are allowed to qualify using bracketed variations within a single model number.
- 301 ○ Multiple fan variations require a similar testing and reporting plan to multiple driver
302 variations, as noted in the efficacy section.

303 • **Warranty**

304 Products shall have a manufacturer-provided product warranty of at least five years for fixtures
305 and three years for lamps. The warranty terms and conditions shall be provided as part of the
306 submittal for qualification. The warranty shall cover the complete luminaire and must clearly
307 explain the terms and conditions associated with the warranty. Note that “luminaire” includes
308 light source, housing, heat sink, power supplies, and other electrical components, optics, and
309 any other components such as cooling fans or controls (if present).

310 Warranty terms and conditions can vary widely from manufacturer to manufacturer. The DLC
311 explicitly defines a warranty period of five years for fixtures and three years for lamps and does
312 not have specific requirements for warranty claim terms (e.g., labor, recommissioning, etc.)
313 other than those listed above. The DLC does not verify or validate a manufacturer’s terms,
314 conditions, or process for customer warranty claims. The DLC does not monitor field failure
315 rates of qualified products, or warranty policy redemption or history among manufacturers.
316 Industry stakeholders are urged to review warranty terms and conditions as part of the
317 purchasing decision process.

318 **Electrical Performance/Power Quality**

319 The DLC requires testing and reporting of the following items to characterize the electrical performance
320 of the fixture:

- 321 • **Power Factor**
322 Products shall have a measured power factor of ≥ 0.90 at any rated input voltage at full output or
323 non-dimmed state.
- 324 • **Total Harmonic Distortion, current (THDi)**
325 Products shall have a measured THDi of $\leq 20\%$ at any rated input voltage at full output or non-
326 dimmed state.

327 For products with driver variations, including input voltage variations, electrical testing of each product
328 shall be performed, sufficient to characterize the power quality of each driver, at its applicable nominal
329 input voltages and maximum designed output power. Testing to demonstrate that products are
330 compliant with the power factor and total harmonic distortion requirements may be done on an in-
331 house or benchtop setup for practical simplicity, and results shall be documented and included in the
332 application materials. Please see the [Efficacy](#) section for more information on the use of this electrical
333 testing for worst-case efficacy driver variation determination. Please refer to the [Level 2 \(formerly
334 Family Grouping\) Testing Requirements for LED-based Horticultural Lighting](#) for specific testing and
335 reporting requirements for product families.

336 Safety

337 Products shall be certified by an OSHA NRTL or SCC-recognized body to ANSI/UL 8800 (ANSI/CAN/UL
338 8800) which is applicable for *horticultural lighting products* by that safety organization.

339 Application Information Requirements

340 Rationale

341 Version 3.0 Draft 1 proposes that applicants report product-level application-oriented information to
342 support developments in energy efficiency programs (e.g. midstream programs) and stakeholders
343 looking to better identify and compare QPL listed products (e.g. growers directed to the QPL by their
344 local efficiency programs to review and select products eligible for incentives).

345 Understanding that lighting technology and strategies in controlled environment agriculture (CEA) are
346 continually advancing, Version 3.0 Draft 1 proposes that applicants report the intended controlled
347 environment and lighting scheme for listed products per **Table 3**. Multiple intended controlled
348 environments and/or lighting strategies may be reported for a single listed product.

349

350 **Table 3:** Application Information Reporting Requirements

Controlled Environment		Lighting Scheme		Requirement Type	Method of Measurement/Evaluation
Indoor	(Stacked)	Top light, intra-canopy, other (text)	Sole-source or Supplemental	Reported	Product specification sheet*
	(Non-stacked)				
Greenhouse		Top light, intra-canopy, other (text)	Sole-source or supplemental	Reported	Product specification sheet*

351 * For verification and evaluation, the respective application information must be clearly stated on the provided specification
 352 sheet for each product.

353 **Controlled Environment**

354 The DLC considers controlled environments to be buildings or structures wherein electric lighting and
 355 other inputs (e.g., air temperature, humidity, and water consumption) can be controlled to grow crops.

356 The following are controlled environments considered in Version 3.0 Draft 1:

- 357 • **Indoor (Stacked or Non-stacked)**

358 Indoor controlled environments are fully enclosed controlled environments with stacked or non-
 359 stacked layers.

- 360 ○ Stacked indoor controlled environments are typically synonymous with vertical farms,
 361 and products listed in this controlled environment should be intended for crops that
 362 have a short stature, short production cycle, and high yield. Products intended for
 363 stacked indoor controlled environments are often highly customizable and scalable.
- 364 ○ Non-stacked indoor controlled environments are indoor facilities with a single canopy,
 365 that do not have multiple vertical layers of crops. Products listed in this category may be
 366 intended for a broader variety of crops with varying stature, production cycle, and yield.

- 367 • **Greenhouse**

368 Greenhouse controlled environments rely on sunlight as a primary light source, but often
 369 require supplemental electric lighting (defined below) while still taking maximum advantage of
 370 available daylight throughout the year to maintain consistent daily light integral (DLI) incident on
 371 the plant canopy. For a variety of reasons, greenhouse controlled environments may require
 372 sole-source electric lighting (defined below).

373 The controlled environment(s) for which the product is intended shall be explicitly and clearly stated in
 374 the product specification sheet.

375 Applicants shall report fixture physical dimensions and a representative image of the fixture (.png
376 format at least 1000 pixels by 1000 pixels), or an active link to the manufacturer website on the QPL for
377 all listed products.

378 **Lighting Scheme**

379 Along with the controlled environment information above, applicants shall report the intended lighting
380 scheme of listed products. Lighting schemes provide insight into how listed horticultural lighting fixtures
381 are intended to deliver optical radiation to the crop/canopy.

382 The following are lighting schemes considered with Version 3.0 Draft 1:

- 383 • **Sole-Source and/or Supplemental**

384 Products reported to be sole-source shall be intended for applications where the lighting fixture
385 is the primary source of optical radiation for inducing photobiological effects in crops.

386 Products reported to be supplemental shall supplement daylight and shall be intended for
387 applications where the lighting fixture is not the primary source of optical radiation for inducing
388 photosynthesis, but is instead intended to supplement a separate primary light source and
389 overall energy usage is not as high (e.g. a specialty lamp that is intended to provide specific
390 spectra to induce a specific growth action in addition to sunlight in a greenhouse or a higher
391 output product with a broader spectra to fully supplement daylight in a northern environment).

- 392 • **Top light, Intra-canopy, or Other (text)**

393 Top light, intra-canopy, or other (text) are required reported information to convey the direction
394 that listed products deliver optical radiation.

395 Products reported to be a top light shall be intended to be mounted with the emission area
396 facing down, toward the canopy.

397 Products reported to be an intra-canopy light shall be intended to be mounted within the
398 canopy.

399 To account for innovative technologies in this developing field, the “other (text)” option
400 supports products that do not fit within the top lighting or intra-canopy lighting categories. For
401 instance, “other (bottom lighting)”.

402 The lighting scheme(s) for which the product is intended shall be explicitly and clearly stated in the
403 product specification sheet.

404 **Key Questions for Application Information Requirements Section**

405 Version 3.0 Draft 1 proposes specific controlled environments and lighting schemes to be reported on
406 the QPL for listed products.

- 407 1. Should the DLC include “residential” as a reported controlled environment option? If so, what
408 lighting scheme options should be considered for residential controlled environments for Draft
409 2?

- 410 2. Considering existing and/or anticipated CEA applications, are there controlled environments or
 411 lighting schemes that are not covered by Draft 1? If so, please specify these applications and
 412 provide terminology recommendations for consideration in Draft 2.
- 413 3. What additional information should be potentially required and/or reported to relate listed
 414 products to the application(s) they are intended to operate in?

415 Controllability Requirements

416 Rationale

417 Version 3.0 Draft 1 establishes a new set of controllability testing and reporting requirements for
 418 horticultural lighting products that allow for increased versatility and energy savings within CEA
 419 environments. The DLC proposes a requirement that all products be capable of dimming. Dimmable
 420 products have the potential to save energy, lay the groundwork for demand response programs, and
 421 prevent over-lighting. Draft 1 also introduces new reporting requirements to promote interoperability
 422 between horticultural luminaires and control systems by representing how each product is controlled on
 423 the QPL.

424 Controllability requirements are outlined in **Table 4**. Details explaining each item follow Table 4.

425 **Table 4: Controllability Requirements**

Parameter/Attribute/Metric	Requirement	Requirement Type	Method of Measurement/Evaluation
Dimming Capability	All products shall have the ability to dim	Required	Product specification sheet*
Dimming Range	n/a	Reported	Product specification sheet or supplemental documentation*
Dimming and Control Method Designations to the Product	n/a	Reported	Product specification sheet or supplemental documentation*
Control Attributes	n/a	Reported	Product specification sheet or supplemental documentation*
Connector / Transmission Hardware	n/a	Reported	Product specification sheet or supplemental documentation*

426 * For verification and evaluation, the corresponding characteristic must be clearly stated on the provided specification sheet for
427 each product and/or supplemental material as specified above. There will be no further evaluation against any other
428 standards. For DC powered products, this information may also be included on the specification sheet for the power supply,
429 if applicable.

430 **Dimming Capability**

431 Products shall be capable of dimming through a line voltage, low voltage, or wireless signal. For
432 verification, the product technical specification sheet (or other documentation noted below **Table 4**)
433 shall state that the product is dimmable.

434 **Dimming Range**

435 To describe the dimming range of the product, each of the following values shall be reported and
436 included on the product specification sheet and/or supplemental documentation:

- 437 • The input power (in Watts) to the product at the minimum dimming level, expressed as a
438 percentage of the maximum power.
- 439 • The minimum dimming level, expressed as a percentage of the maximum PPF.
 - 440 ○ If the product is capable of being turned off via the control signal (dim to off), this field
441 may be reported as “0%”.
- 442 • The default PPF in units of $\mu\text{mol} \times \text{s}^{-1}$.
 - 443 ○ The default PPF occurs at the default setting, at which the product is shipped with no
444 adjustments.
 - 445 ○ If no default PPF is provided on the product specification sheet or supplemental
446 material, it is assumed that the default PPF is the same as the maximum PPF.

447 **Dimming and Control Method Designations to the Product**

448 All available dimming and control method designations between the product and other devices shall be
449 reported and stated on the product technical specification sheet or supplemental documentation (noted
450 under **Table 4**). Options for reporting are included in **Table 5**. The “Acceptable Terms” column includes
451 terms that may appear on the provided documentation to indicate the use of the corresponding
452 dimming or control method. Multiple selections may be made.

453 If multiple drivers are offered for a single product, each with a unique dimming or control method, these
454 options may be bracketed into a single line item on the QPL. However, model numbers must still
455 indicate specific dimming or control methods available. Multiple dimming or control methods may not
456 be represented by an asterisk or other generic character in a single model number if driver or product
457 changes are necessary to achieve the method of control (the DLC refers to this type of representation as
458 “wildcarding”).

459 Exceptions may be made for DC-powered products and replacement lamps. For further information, see
460 [Special Considerations](#) below.

Table 5: Dimming and Control Method Designations to the Product

Control Type (as displayed on the QPL)		Definition	Acceptable Terms	
Wired	0-10V IEC 60929 Annex E	Wired analog low-voltage control that varies DC voltage between 0 and 10 volts (or 1 and 10 volts) to produce varying light output.	0-10V, 1-10V, 10V, 10V0	
	0-10V ANSI C137.1-2019 (8-Volt)			
	0-10V ANSI C137.1-2019 (9-Volt)			
	0-10V Other			
	DALI	Digital Addressable Lighting Interface Protocol, a wired digital communication protocol registered by the DALI alliance.	DALI	
	DALI2		DALI2, DALI-2	
	Other Wired	Other wired communication protocol as specified by the manufacturer.	N/A	
Zigbee				
Wireless	Zigbee 3.0	Wireless digital communication protocol developed by the Connectivity Standards Alliance.	Zigbee 3.0, ZB3	
	Zigbee – Manufacturer Specific		ZigBee	
	Bluetooth			
	BLE MDP v2	Wireless digital communication protocol developed and maintained by the Bluetooth Special Interest Group (SIG).	Bluetooth SIG mesh version 2, BLE SIG mesh v2	
	BLE SIG Mesh v1.x		Bluetooth SIG mesh version 1, BLE SIG mesh v1	
	BLE Proprietary		Bluetooth mesh, BLE mesh	
	Wi-Fi	Wireless networking protocol based on IEEE 802.11.	Wi-Fi, WIFI, IEEE 802.11, Wi-Fi Certified	
	EnOcean	Wireless digital communication protocol developed by EnOcean.	EnOcean	
	Other Wireless	Other wireless communication protocol as specified by the manufacturer.	N/A	

464 **Control Attributes**

465 All available control attributes listed in **Table 6** shall be reported. If applicable, this information shall be
 466 included on the product technical specification sheet or supplemental documentation (noted under
 467 **Table 4**) with one or more of the terms from the “Acceptable Terms” column. Multiple selections may
 468 be made. If a product does not include any of the attributes in **Table 6**, this field may be left blank.

469 **Table 6: Control Attributes**

Control Attributes	Definition	Acceptable Terms
Dim to Off	The ability for a product to be turned on or off via a dimming control signal.	Dim to off, Dimming: 0%-100%
High End Trim	The capability to set the maximum light output to a less-than-maximum state of an individual luminaire/lamp at the time of installation or commissioning. High-end trim must be field reconfigurable.*	High-End Trim, Task Tuning
Energy Monitoring	The capability of a system to report the energy consumption of a luminaire/lamp.	Power/Energy Monitoring, Power/Energy Metering, Power/Energy Measurement Power/Energy Reading
Manual Dimming	A knob or other control device integrated into the fixture used for manual dimming.	Manual Dimming, Knob Dimming, Dimming Knob, Fixture Integrated Dimming, Dimming Switch

470 * In addition to the presence of acceptable terms, product submissions that report high end trim will be evaluated to ensure
 471 that high end trim is field reconfigurable, and that this is clearly represented on the product specification sheet or
 472 supplemental material.

473 **Connector/Transmission Hardware**

474 The connector/transmission hardware is the hardware integrated into the product that enables it to
 475 physically connect with and receive signals from a controller or other device. All available
 476 connector/transmission hardware shall be reported and stated on the product technical specification
 477 sheet or supplemental documentation (noted under **Table 4**) using one or more of the terms from the
 478 “Acceptable Terms” column in **Table 7**. Options for reporting are listed below. Multiple selections may
 479 be made. If variations are offered for a single product, each with a unique connector/transmission
 480 hardware option, these options may be bracketed into a single line item on the QPL.

481 **Table 7: Connector/Transmission Hardware Options**

Connector / Transmission Hardware		Acceptable Terms
Wired	RJ-11	RJ-11, RJ11
	RJ-12	RJ-12, RJ12
	RJ-45	RJ-45, RJ45
	Terminal Block	Terminal Block
	Other Wired	N/A
Wireless Radio		Wireless, Bluetooth, BLE, Wi-Fi, WIFI, IEEE 802.11, Zigbee, EnOcean

482

483 **Key Questions for Controllability Requirements Section**

- 484 1. Draft 1 proposes that all products qualified under V3.0 shall be dimmable. Is this requirement
485 reasonable? If not, what is the value proposition for non-dimmable products?
- 486 2. Draft 1 proposes to include default PPF as a reported value. This may be valuable in cases where
487 the default PPF is lower than the maximum PPF. Are there products on the market today that
488 are designed this way, or is it standard for products to come with the maximum PPF as the
489 default?
- 490 3. Table 5 aims to capture the dimming and control method designations that are prominent in
491 horticultural lighting products. Are there any dimming or control method designations or
492 additional attributes used in horticultural fixtures that are not listed here and would be valuable
493 to include in Table 5 (e.g., DMX or other Zigbee classifications)? For those that are listed in Table
494 5, are the acceptable terms provided sufficient?
- 495 4. Table 6 aims to capture the prominent control attributes that are important for interoperability
496 and design considerations. Are there any control attributes not listed in Table 6 that would be
497 valuable to include and list on the QPL?
- 498 5. Draft 1 proposes to include connector/transmission hardware as a reported attribute. Should
499 this information be captured and listed on the QPL, and if so, a) are the acceptable terms
500 provided sufficient or are more needed, and b) are there any connector/transmission hardware
501 options not listed here that are commonly used in horticultural lighting?
- 502 6. In the [Special Considerations for DC-Powered Products](#) section of this document, the DLC has
503 stated that for DC-powered fixtures that do not specify a power source intended for use, the
504 “Dimming and Control Method Designations to the Product” refers to the method of
505 communication to the fixture. Are there any dimming or control methods that should be added
506 to Table 5 that are used by DC-powered fixtures with an unspecified power source? Are there
507 any other special considerations needed for controllability of DC-powered products that are not
508 captured here?

509 Special Considerations

510 Special Considerations for Spectrally Tunable Products

511 Spectrally tunable products (products with varying output channels beyond simple, single-axis dimming
512 of the whole product) are eligible with the following conditions:

- 513 • The threshold-qualifying state to be tested shall be the manufacturer-designed state with the
514 highest power consumption (“maximum power”). This may or may not be the same as an “all
515 channels on” condition since fixtures may not be designed to use all their channels
516 simultaneously. Test reports shall specifically indicate that the product is operated in this
517 “maximum power” condition during the testing, with a description of the control narrative to
518 ensure that the power state is at its maximum designed level.
- 519 • In addition to the “maximum power” condition, applicants shall perform PPF testing for each
520 control channel, in which the channel under test shall be set to the maximum designed output,
521 and all other channels shall be set to their minimum designed output for this state. The test
522 report shall present an identifying name of this channel and setting, the PPF (400-700nm total
523 and 400-500nm, 500-600nm, and 600-700nm “bins” PPF) and PF_{FR} (700-800nm) for each of the
524 single-channel scenarios, and a description of the control narrative to achieve each setting. For
525 each channel tested, a corresponding graphic for the SQD produced in that setting shall be
526 provided in the application. Refer to the [SQD](#) section for reporting requirements.
 - 527 ○ The flux output of each specific channel testing is displayed on the DLC Horticultural
528 QPL, with the per-channel test outcomes and identifying information for each setting.
529 These data are intended to support standardized communication of information about
530 the product’s spectral tuning range, aiding product selection and user acceptance.
- 531 • Applicants shall provide user-facing documentation narrating the control protocol and input
532 parameters employed in controlling the output and shall comply with the [Controllability](#)
533 [Requirements](#) listed above.
- 534 • For PFM_P and PFM_{FR} evaluation:
 - 535 ○ Provisions for products utilizing multiple types of LEDs shall be followed as described in
536 the [For fixtures using multiple types of LEDs](#) section.
 - 537 ○ ISTMT testing shall be provided on the hottest of each of the LED types. For each unique
538 LED type, ISTMT testing shall occur at the operating mode that produces the highest
539 operating temperature in the fixture for this LED type. Test reports shall specifically
540 indicate that the product is operated in this “highest operating temperature” condition
541 during the testing, with a description of the control narrative to ensure that the power
542 state is at its highest operating temperature designed level.
 - 543 ○ The DLC asks any applicants considering LM-84-based maintenance testing on a
544 spectrally tunable fixture to contact horticulture@designlights.org to discuss their
545 proposed testing plan.

546 **Special Considerations for DC-Powered Fixtures**

547 **Eligibility Information**

548 Horticultural lighting fixtures powered by direct current (DC) are eligible for listing on the Horticultural
549 QPL. DC-powered fixtures include two types:

- 550 • **Modular and/or dynamically configurable fixtures where one or several AC-to-DC power**
551 **sources supply power to multiple fixtures/modules.** The power source(s) may have a minimum
552 as well as a maximum number of fixtures that they may serve. The AC-to-DC power source(s)
553 may be attached to one of the fixtures or may be located remotely from the fixtures. The power
554 source(s) must be marketed by the fixture manufacturer as the intended power source(s) for
555 that specific fixture model or family.
- 556 • **Fixtures that operate on DC power, where an AC-to-DC power source is not marketed by the**
557 **fixture manufacturer as the intended power source.** These fixtures may be wired to an AC-to-
558 DC power source outside the fixture or in a separate room, or may be part of a DC-only
559 horticultural facility.

560 **Technical Requirements for DC-powered Fixtures**

561 All V3.0 Horticultural Lighting Technical Requirements described in **Table 1** shall be met in addition to
562 the following requirements, with exceptions as noted. The following requirements apply to applications
563 for DC-powered fixtures, in place of the equivalent AC testing and reporting:

- 564 • **DC-powered “all-on” photon flux test report:** Applicants shall provide an LM-79 report in PDF
565 format from an accredited third-party test lab with all required photon flux and power values for
566 verification, including DC voltage, current, and power. This is the test report of the product at
567 the maximum (non-dimmed) power state of the product.
- 568 • **Power source test report:** If power sources are marketed with the DC-powered fixture,
569 applicants shall provide a table of the following performance values for all power sources
570 offered for sale with the DC fixture. These values may come from benchtop testing
571 (measurements performed by a manufacturer that are not from a certified testing lab). All
572 values shall be provided at the reported minimum and maximum AC input voltages for each
573 power source, as well as at each DC output voltage utilized by the DC-modular fixture (if
574 multiple). A power source specification sheet or other documentation from the power source
575 manufacturer with numerical values listed for each load point may satisfy this requirement, in
576 place of testing.
 - 577 ○ Performance values shall be provided at each of two load points as determined by the
578 fixture manufacturer:
 - 579 ■ Maximum power load, i.e., the load representing the maximum number of light
580 fixtures that can be powered by this power source.
 - 581 ■ The load point of the power source between maximum power load and 20% of
582 maximum load that results in the worst-case power source efficiency.

- 583 – Only load points achievable with multiples of this fixture at full output
- 584 need to be considered in identifying the worst-case power source
- 585 efficiency. For example, for a 100W power source that may power
- 586 either two or three 30W fixtures, only the 60% and 90% loading
- 587 conditions need to be compared to determine the worst-case efficiency.
- 588 – A lower limit on load points may also be set by the loading requirement
- 589 for a given power source listed on the fixture specification sheet. For
- 590 example, “required operating range of 15-90W output at 100W input
- 591 power.”

- 592 ○ The following performance values shall be reported in the power source test report:
 - 593 ▪ Nominal AC input voltage
 - 594 ▪ Maximum output power of the power source at the specified input voltage,
 - 595 shown to the nearest watt
 - 596 ▪ Minimum and maximum output power for the specific combination of power
 - 597 source and horticultural fixture at full output, shown to the nearest watt
 - 598 ▪ Loading percentage (the ratio of tested DC output power to maximum output
 - 599 power with this fixture), shown to the nearest tenth of a percent
 - 600 ▪ Tested AC input power, shown to the nearest hundredth of a watt
 - 601 ▪ Tested DC output power, shown to the nearest hundredth of a watt
 - 602 ▪ Electrical efficiency (power source output power divided by power source input
 - 603 power), shown as a percentage to two decimal places
 - 604 ▪ Power factor, shown to three decimal places
 - 605 ▪ Total harmonic distortion of the current waveform as a percentage, shown to
 - 606 one decimal place

- 607 ○ The following example shows this table for a single power source:

Manufacturer Name			Model Number			AC Input Voltage Range (V)		DC Output Voltage Range (V)		
ABC Corp.			ABC123			120-277		48		
Nominal AC Input Voltage (V)	Power Source Maximum Output (W) [Output rating irrespective of fixture]	Minimum Output Power with this fixture type (W) [fixture type at full output]	Maximum Output Power with this fixture type (W) [fixture type at full output]	Loading Scenario	Loading Percentage (%) [Relative to maximum for this fixture type-power source combination]	Tested AC Input Power (W)	Tested DC Output Power (W)	Tested Efficiency (%)	Power Factor	Total Harmonic Distortion (current) (%)
				Worst-Case Efficiency	20.0	677.63	600.00	88.54	0.914	4.0
277	3100	300	3000	Full	100.0	3098.02	3000.00	96.84	0.932	5.6
				Worst-Case Efficiency	20.0	665.19	600.00	90.20	0.911	5.9

- 608 ○ Fixtures where no AC-to-DC power source is marketed by the fixture manufacturer as
- 609 the intended power source with any AC-to-DC power source are not required to provide
- 610 a power source test report. These products will be listed with an assumed AC-to-DC
- 611 conversion efficiency (see below).

- 612
- 613
- 614
- 615
- **Power source ISTMT report:** Consistent with the Horticultural Technical Requirements for drivers, power source ISTMT reports are required for all horticultural products sold with AC-to-DC and DC-to-DC power sources, as applicable. DC-to-DC power source ISTMT reports are required for both DC fixture types described in the “Eligibility Information” section above.
 - DC-to-DC power sources include any component that modifies the current or voltage input to the LED chips, either in value relative to input (e.g., a voltage converter) or value over time (e.g., a constant current power source).
 - AC-to-DC power sources, in the context of DC-powered products, include components external to the listed product that convert AC power to DC power.
 - **Information or specifications for DC cabling:** Manufacturers shall provide information or specifications for DC cabling on the fixture specification sheets or supplemental marketing documentation. Guidance for maintaining cabling losses to less than 2% for a fully loaded power supply shall be detailed.
 - The fixture wattage in the cabling guidance shall match the input power of the submitted fixture, and the cabling losses shall reflect the copper resistance values listed in [NFPA 70 National Electrical Code, 2020 Edition](#). Applicants may choose their own tradeoff of cabling gauge and length, as long as it conforms with cabling information provided on the fixture specification sheet.

630 **Controllability Interactions with DC-specific Requirements**

631 All controllability requirements from **Table 4** shall be met, with the following adjustments and
632 clarifications:

- 633
- 634
- 635
- 636
- For DC-powered fixtures that utilize a specific central AC to DC power source marketed for use with the product, the “Dimming and Control Method Designations to the Product” refers to communication between the power supply and the dimming controller. The options from **Table 5** apply.
 - In cases where no power source is marketed for use with the product, “Dimming and Control Method Designations to the Product” refers to the signal received by the product. The options from **Table 5** apply.
 - For wired DC-powered fixtures that utilize a central AC to DC power source, the “Connector/Transmission Hardware” refers to the port or terminal on the fixture that a control cable connects to.

643 **QPL Listing Information for DC-powered Fixtures**

644 DC-powered fixtures will be listed on the Horticultural Lighting QPL with the following differences from
645 AC-powered fixtures.

646 The following new fields will be listed on the QPL. Unless noted below, all DC numerical fields below will
647 have an equivalent tested value and reported, or nominal, value provided by the submitter in the
648 review.

- 649
- **“Input Power Type”** will be distinguished between AC and DC products.

- 650
- 651
- 652
- 653
- 654
- 655
- 656
- 657
- 658
- 659
- 660
- 661
- 662
- 663
- 664
- 665
- 666
- 667
- 668
- 669
- 670
- 671
- 672
- 673
- 674
- 675
- 676
- 677
- 678
- 679
- 680
- 681
- 682
- 683
- 684
- 685
- 686
- 687
- 688
- **“Tested Voltage”** and **“Tested DC Input Current”**, from the all-on DC-powered LM-79 photon flux report for both DC-powered fixture types. Nominal values for **“Reported Maximum Input Voltage”**, **“Reported Minimum Input Voltage”**, and **“Reported DC Input Current”**, are provided by the submitter during application submittal.
 - **“DC Input Wattage”** and **“DC Photosynthetic Photon Efficacy (μmol/J) (400-700nm)”** will display the values from the all-on DC-powered LM-79 photon flux report.
 - Optional new field **“DC PE_{PBAR} (μmol/J) (280-800nm)”** will be reported if **“DC PF_{PBAR} (μmol/J) (280-800nm)”** is reported.
 - New fields will display **“AC De-rated Input Wattage”** and **“AC De-rated PPE (μmol/J) (400-700nm)”** only for DC-powered fixtures.
 - DC-powered fixtures shall meet the PPE threshold requirement at their AC de-rated PPE value.
 - For example, a 100W lightbar with a DC-powered PPE of 2.5 μmol/J and a power source with a worst-case efficiency of 90% at 20% load would be listed on the QPL at 2.25 μmol/J AC De-rated PPE and 105W AC De-rated Input Wattage.
 - The fields currently used for **“Photosynthetic Photon Efficacy: 400-700 nm, μmol/J (PPE) (AC)”** will not be populated.
 - DC-powered fixtures marketed with any AC-to-DC power source will reflect the power efficiency of the AC-to-DC conversion at the load condition that creates the worst-case efficiency.
 - For example, a 100W lightbar with a PPE of 3.0 μmol/J and a power supply showing a worst-case efficiency of 85% at 20% load, would be listed on the QPL at 2.55 μmol/J and 118W.
 - DC-powered fixtures that are not marketed with any AC-to-DC power source will display values in the AC de-rated fields based on an assumed 87.5% conversion efficiency. 87.5% is informed by the [Federal Standard 10 C.F.R. § 430.32\(w\)](#) for minimum efficiency for external power supplies greater than 250W.
 - Optional new field **“AC De-rated PE_{PBAR} (μmol/J) (280-800nm)”** will be reported if **“DC PE_{PBAR} (μmol/J) (280-800nm)”** is reported.
 - **“Power Source Loading Percentage”** will display the fixture loading that creates the worst-case efficiency used in the de-rating calculations and the power source load point that creates that worst-case condition, in the format "AC-derated performance is 91.12% efficiency at 20% loading on a 3000W power source at 120V."
 - **“Cabling Loss Example”** will show an example of cabling length and gauge that results in cabling losses less than 2% for a fully-loaded power supply.
 - For example: **“Nine 300W fixtures parallel-wired with 100 feet of 10AWG cabling to a 3,000W power supply channel.”**
 - This field will be populated only for DC-powered fixtures marketed with an AC-to-DC power source.

- 689
- 690
- 691
- 692
- The worst-case values of total harmonic distortion (current) and power factor from the Tested Power Source Table will be shown in the existing fields for “**Total Harmonic Distortion**” and “**Power Factor**.” THDi and power factor fields will be populated only for fixtures marketed with an AC-to-DC power source.

693 **Special Considerations for Externally Supplied Actively Cooled Fixtures**

694 **Eligibility Information**

695 LED horticultural fixtures that employ externally supplied circulating liquid are eligible with the following
696 conditions described below.

- 697
- 698
- 699
- 700
- 701
- 702
- 703
- The DLC defines externally supplied circulating-liquid-cooled horticultural fixtures to be products in which liquid, often water or a water/glycol solution, flows through input and output ports of each fixture in the system, being channeled through a cooling plate or other heat exchanger within the fixture.
 - LED horticultural fixtures that employ externally supplied ducted forced air are not eligible at this time. For simplicity, Version 3.0 may refer to eligible externally supplied actively cooled fixtures as ‘actively cooled’.

704 **Technical Requirements for Externally Supplied Actively Cooled Fixtures**

705 All V3.0 Horticultural Lighting Technical Requirements described in **Table 1** shall be met in addition to
706 the following requirements and clarifications:

- 707
- 708
- 709
- 710
- 711
- 712
- 713
- 714
- 715
- 716
- 717
- 718
- 719
- 720
- 721
- 722
- 723
- 724
- Manufacturers shall specify information regarding allowable operating conditions that affect product performance, including:
 - **Solution type/concentration:**
 - Restrictions or limitations to allowable solution type/concentration shall be described in marketing material/specification sheets and will be reported on the Hort QPL.
 - **Inlet fluid temperature range:**
 - Minimum and maximum allowable operating inlet fluid temperatures shall be stated in marketing material/specification sheets and will be reported on the Hort QPL.
 - Data describing the performance impact of varying inlet fluid temperature on measured PPF and measured input power of the fixture, reported in increments of 5 degrees Celsius (or smaller) covering the complete allowable inlet fluid temperature range, shall be provided. A template file will be available for actively cooled applications to capture this data. The template file will be used to generate and report an image of this data on the QPL.
 - Flow rate shall be held constant across the allowable temperature range and shall be reported.

- 725
- 726
- 727
- 728
- 729
- 730
- 731
- 732
- 733
- 734
- 735
- 736
- 737
- 738
- 739
- 740
- 741
- 742
- 743
- 744
- 745
- 746
- 747
- 748
- 749
- 750
- 751
- 752
- 753
- 754
- 755
- 756
- 757
- 758
- 759
- 760
- 761
- Measured PPF as a function of inlet fluid temperature data and measured input power as a function of inlet fluid temperature data shall be provided and will be reported on the Hort QPL.
 - All temperature values shall be reported in degrees Celsius.
 - **Self-protect cut-off functionality:**
 - Fail to off functionality shall be present to turn off the actively cooled fixture before a maximum inlet fluid temperature is reached, in the event that the external cooling system fails.
 - Self-protect cutoff temperature shall be stated in manufacturer-provided marketing material/specification sheet and will be reported on the Hort QPL.
 - All inlet fluid temperatures shall be maintained within a tolerance of +/- 2.5 degrees Celsius to the target temperature during LM-79 and ISTMT testing.
 - LM-79 testing shall employ water as the cooling liquid at an appropriate flow rate to maintain the targeted *median inlet fluid temperature* (i.e., middle operating inlet fluid temperature in the allowable range) as defined by the luminaire manufacturer.
 - The average and maximum inlet fluid temperature measured during LM-79 testing (measured at fixture-level stabilization per LM-79), within the allowable 5-degree Celsius range, shall be provided and reported on the Hort QPL.
 - ISTMT testing shall employ water as the cooling liquid at an appropriate flow rate to maintain the targeted *worst-case inlet fluid temperature* (i.e., maximum allowable operating inlet fluid temperature) as defined by the luminaire manufacturer. The average and maximum inlet fluid temperature measured during ISTMT testing (at stabilization), within the allowable 5-degree Celsius range, shall be provided and will be reported on the Hort QPL.
 - Flow rate, measured in gallons per minute (GPM), shall be recorded during LM-79 and ISTMT testing, with the average and highest flow rate measurements being provided and reported on the Hort QPL.
 - Outlet fluid temperature shall be measured during LM-79 testing, with the average and highest outlet fluid temperature reported on the Hort QPL.
 - To support the qualification of externally supplied circulating liquid cooled horticultural fixtures, the DLC will accept LM-79 gonioradiometric testing with methods or equipment ranging from Type C goniometers to other gonioradiometer types.
 - All externally supplied circulating liquid cooled horticultural fixtures seeking qualification by the DLC shall test the fixture per ANSI/IES LM-79, including requirements specific to, but not limited to, stabilization and optical measurements, while employing active cooling.
 - The DLC reserves the right to require additional information on all LM-79 test reports derived from non-Type-C gonioradiometer types.

762 **QPL Listing Information**

763 In addition to the existing fields, externally supplied actively cooled fixtures will have the following
764 information listed on the QPL:

- 765 • **“Active Cooling Presence”**
 - 766 ○ Externally supplied circulating liquid cooled horticultural fixtures will be distinguished as
 - 767 “active cooling presence” and will be designated as such on the Hort QPL (e.g., as a
 - 768 filterable field)
- 769 • **“Tested Inlet Fluid Temperature” and “Tested Flow Rate”**
 - 770 ○ Maximum measured inlet fluid temperatures and flow rates per ISTMT and LM-79
 - 771 testing
 - 772 ○ Average measured inlet fluid temperatures and flow rates per ISTMT and LM-79 testing
- 773 • **“Tested Outlet Fluid Temperature”**
 - 774 ○ Maximum measured outlet fluid temperature per LM-79 testing
 - 775 ○ Average measured outlet fluid temperature per LM-79 testing
- 776 • Additional reporting fields, relating to the allowable operating conditions for the system
777 including:
 - 778 ○ **“Solution Concentration Restrictions”**
 - 779 ○ **“Minimum Allowable Inlet Fluid Temperature” and “Maximum Allowable Inlet Fluid**
 - 780 **Temperature”**
 - 781 ○ **“Self-Protect Cut-Off Temperature”**
 - 782 ○ Reported data depicting PPF and wattage as a function of inlet fluid temperature.

783 **Special Considerations for LED Replacement Lamps**

784 **Eligibility Information: Linear Replacement Lamps**

785 LED replacements for linear fluorescent lamps are eligible with the following conditions:

- 786 • The DLC defines all tube-style LED products that use lamp holders (i.e., sockets or tombstones)
787 in the luminaire to mechanically and/or electrically connect to the fixture housing and electric
788 supply to fall under these testing requirements. Products that do not employ lamp holders are
789 not eligible as lamps under this policy.
- 790 • The DLC defines bare lamp as the performance characteristics of a replacement lamp, including
791 the effects of an external ballast (for Type A and Dual Mode lamps) or driver (for Type C lamps),
792 if applicable, when operated outside of a luminaire or retrofit kit.
- 793 • The following linear lamp replacement types (i.e., T8, T5, or T5HO) and specific lengths are
794 eligible for listing. Marketing material shall indicate that they are intended to replace
795 fluorescent lamps of the same type and length. Products of different lengths, bases, or
796 marketed as intended to replace other types of fluorescent lamps are not eligible. Products
797 intended to operate on magnetic ballasts or those with different base types are not eligible.

- 798 ○ **T8 Two-Foot Linear Replacement Lamps**
- 799 LED lamps intended to replace T8 fluorescent lamps. These LED lamps shall be 24 inches
- 800 long and employ a G13 base.
- 801 ○ **T8 Four-Foot Linear Replacement Lamps**
- 802 LED lamps intended to replace T8 fluorescent lamps. These LED lamps shall be 48 inches
- 803 long and employ a G13 base.
- 804 ○ **T8 Eight-Foot Linear Replacement Lamps**
- 805 LED lamps intended to replace T8 fluorescent lamps. These LED lamps shall be 96 inches
- 806 long and employ a FA8 base.
- 807 ○ **T5 Four-Foot Linear Replacement Lamps**
- 808 LED lamps intended to replace T5 fluorescent lamps. These LED lamps shall be 46 inches
- 809 long and employ a G5 base.
- 810 ○ **T5HO Four-Foot Linear Replacement Lamps**
- 811 LED lamps intended to replace T5HO (High Output) fluorescent lamps. These LED lamps
- 812 shall be 46 inches long and employ a G5 base.
- 813 ● The following UL Types A, B, Dual Mode (AB) and C are eligible for listing.
- 814 ○ **Internal Driver/Fluorescent Ballast (UL Type A):**
- 815 Products of this type employ lamp holders to connect to the fixture being retrofitted and
- 816 are designed to be "plug and play" replacements for fluorescent lamps. That is, products in
- 817 this category operate utilizing an existing fluorescent ballast, and do not require additional
- 818 mechanical or electrical changes to the fixture.
- 819 ○ **Internal Driver/Line Voltage (UL Type B):**
- 820 Products of this type employ lamp holders to connect to the fixture being retrofitted, but do
- 821 not operate utilizing the existing fluorescent ballast. These products require rewiring of the
- 822 existing fixture to bypass the ballast and send line voltage directly to the lamp holders.
- 823 ○ **Dual Mode Internal Driver (UL Type A and Type B):**
- 824 Products of this type can either use the existing fluorescent ballast or be operated using line
- 825 voltage if the fixture is rewired to bypass the ballast. These products connect to the fixture
- 826 using standard lamp holders.
- 827 ○ **External Driver (UL Type C):**
- 828 Products in this category employ lamp holders to connect to the fixture being retrofitted.
- 829 They do not use the existing fluorescent ballast and require rewiring of the existing fixture
- 830 to replace the ballast with an external driver (i.e., the driver is internal to the fixture but
- 831 external to the lamp). The lamp holders are then wired to connect to the external driver.
- 832 For Type-C lamp systems with non-identical lamps, refer to the *Special Considerations for*
- 833 *Linear Replacement Type-C Lamp Systems with Non-Identical Lamps* as written in the [SSL](#)
- 834 [Testing and Reporting Requirements for Linear Replacement Lamps](#).

835 **Testing Notes: Linear Replacement Lamps**

836 For Type A and Dual Mode Type A/B linear replacement lamps designed to operate on an existing
837 fluorescent ballast, the PPE, PPF, and wattage performance shall represent the combined lamp + ballast
838 system. LM-79 testing shall be conducted using a ballast consistent with **Table 8**. Specification sheets for

839 the ballast used during testing shall be provided with the application and the ballast make and model
840 number shall be noted in the test report. Ballasts used in testing shall be certified to the applicable
841 safety standards and shall comply with applicable ANSI standards.

842 **Table 8:** Type A and Dual Mode Reference Ballast Criteria

General Applications	Reference Ballast for Type A and Dual Mode Type A/B
T8 Linear Replacement Lamps	T8 electronic instant-start ballast with 0.88 ballast factor
T5/T5HO Linear Replacement Lamps	T5/T5HO electronic programmed-start ballast with 1.0 ballast factor

843 For Type-B and Type-C products (i.e., lamp-style retrofit kits, which connect mechanically and/or
844 electrically to the fixture via standard lamp holders, but which require an electrical modification to the
845 existing fixture), “lamp”-level testing is also required.

846 If the system is designed to operate multiple lamps utilizing an external driver, the driver shall be loaded
847 as it would be in the field, with appropriate steps taken to calculate the PPE of the single lamp. For
848 example, for a two-lamp kit, one lamp should be measured for PPF, while the system as intended (with
849 two identical lamps on the driver) should be measured for electrical input. The wattage into the driver
850 can then be divided by two, and that wattage divided into the lamp lumens to determine system PPE.

851 Appropriate steps to measure the electrical and photometric properties of the lamp system, under most
852 circumstances, would be to load the driver or ballast appropriately, then isolate a single lamp in the
853 apparatus being used for photometric measurements. In a sphere, for example, this could be
854 accomplished by placing one lamp from the system inside the sphere, while the other one is outside the
855 sphere.

856 Goniophotometric testing of bare lamps is also required for verification of beam angle. Understanding
857 that it may be challenging to properly isolate a single lamp from a multi-lamp system in a
858 goniophotometer, the DLC will accept testing that conforms to the LM-79 standard and operates the
859 lamp directly on DC power, eliminating the external driver or ballast from the system. The only results of
860 this test that will be used in the application review will be the candela array for calculations of beam
861 angle. All other measurements will not be used in the application review.

862 If testing using this method:

- 863 • The power supplied by the lab power supply to the lamp should match that which the lamp would
864 receive from the ballast or external driver.
- 865 • A separate LM-79 report from an integrating sphere shall be provided on the lamp under test.
- 866 • The goniophotometric test report shall explicitly and clearly state the test conditions (i.e., without
867 driver/ballast).

868 For questions, please contact horticulture@designlights.org.

869 **Eligibility Information: Screw-Base Replacements for HID Lamps**

870 LED replacements for mogul-base high intensity discharge (HID) lamps are eligible with the following
871 conditions:

- 872 • The DLC accepts Horticultural QPL applications for mogul (E39 and E40) screw-base replacement
873 lamps. Only UL Type B products, which require removal of the existing ballast from the circuit
874 and the lamp holder to be wired with line voltage, are eligible.
 - 875 ○ Other base types and UL Types are not eligible at this time.
 - 876 ○ Lamps with [field adjustable light distribution](#) (FALD) are not eligible at this time.

877 **Technical Requirements Information: All Replacement Lamps**

878 All replacement lamps seeking horticultural lighting qualification shall test the bare lamp according to
879 LM-79 to meet all V3.0 Horticultural Lighting Technical Requirements for fixtures as described in **Table 1**,
880 except for driver lifetime and a five-year warranty. These exceptions are described below:

- 881 • Instead of driver lifetime:
 - 882 ○ Lamps shall have a lifetime of at least 50,000 hours.
 - 883 ○ Lamps shall perform an In-Situ Temperature Measurement Test (ISTMT) and report at
884 the product's highest rated ambient temperature using a location on the lamp body,
885 which will have the highest temperature of any point on the lamp during normal
886 operation, designated by the manufacturer to correlate to the lifetime with the lifetime
887 of the lamp.
 - 888 ○ Applicants shall supply a technical specification sheet for their product, showing the
889 lifetime based on the given location's operating temperature and an image/diagram
890 showing the temperature measurement point (TMP) location on the lamp body for
891 monitoring the operating temperature.
 - 892 ○ In-situ temperature measurement testing shall be conducted, and a report shall be
893 provided with the application showing an operating temperature measurement point
894 (TMP) consistent with the specification sheet information and measured temperature
895 demonstrating that the lamp will have a lifetime of at least 50,000 hours when
896 operating at or above the highest rated ambient temperature on the lamp's
897 specification sheet.
- 898 • Instead of a five-year warranty:
 - 899 ○ LED replacement lamps shall have a manufacturer-provided product warranty of at
900 least three years. All other requirements of warranty described in this document still
901 apply to lamps.

902 In addition to meeting all V3.0 Horticultural Lighting Technical Requirements for fixtures (except those
903 noted above), lamps shall meet the following additional requirements:

- 904 • All replacement lamps shall report beam angle during the application process. This information
905 will be displayed on the QPL.

- 906
- All replacement lamps shall report product size information (length, width, height, diameter, as applicable) on the technical specification sheet. This information will be displayed on the QPL.
- 907

908 **Controllability Interactions: All Replacement Lamps**

909 As with all other types of horticultural products, LED replacement lamps shall be dimmable. Because
910 lamps are most often used in retrofit applications, there are special considerations needed to ensure
911 end users can dim lamps as desired. The following considerations apply to each UL Type of linear
912 replacement lamps and mogul-screw base lamps, as appropriate:

913 **UL Type A**

- With the exceptions noted below, Type A lamps capable of wired dimming solely via input from the existing ballast should enter “Other; Dimmable depending on ballast capability” in the “Dimming and Control Method Designations to the Product” field, as wired control signals are received by the ballast and not the lamp itself. All other fields should be filled in as applicable.
 - Due to the lack of dimmable ballasts available in the marketplace for eight-foot T8 fluorescent lamps, Type A, T8 eight-foot lamps that claim wired dimming capability utilizing the direct input from the ballast to achieve dimming will be rejected.
 - Any Type A lamps which do not solely utilize the ballast input to achieve dimming capability through a wired dimming or control method (i.e., the dimming control wires connect directly to the lamp) shall report the specific wired dimming or control method and provide a wiring diagram.
 - For the two exceptions above, if an external device is used between the dimming control user interface and Type A lamp, then these lamps will be classified as “Other Wired: Input Signal from External Control Source” and should indicate this on the application form in the “Dimming and Control Method Designations to the Product” field as “Other Wired: Input signal from external control source”. The wiring diagram noted above will be evaluated by reviewers to determine if an external device is required to achieve the specific dimming or control method.
- 925
- 926
- 927
- 928
- 929
- 930
- 931

932 **UL Type B**

- In addition to reporting dimming capability, dimming range, presence of control attributes, and dimming and control method designations, Type B lamps that claim to be dimmable via a wired dimming or control method with 0- 10V or DALI shall provide a wiring diagram in the product specification sheet, installation instructions, or separate document showing the electrical circuit of the lamp connecting to mains power, including the location of the input signal from an external control source to the lamp or lamp holder for 0-10V or DALI control.
 - Type B lamps listed for operations with 0-10V or DALI communication control shall be able to achieve this dimming capability without an external signal converter and the low voltage control wires shall connect directly to the lamp or lamp holders.
 - If an external device is used to receive the 0-10V or DALI control signal, then these lamps will be classified as “Other Wired” and should indicate this on the application form in the “Dimming and Control Method Designations to the Product” field as: “Other
- 933
- 934
- 935
- 936
- 937
- 938
- 939
- 940
- 941
- 942
- 943
- 944

945 Wired: Input signal from external control source”. The wiring diagram noted above will
946 be evaluated by reviewers to determine if an external device is required to achieve the
947 specific dimming or control method.

948 **UL Type A/B Dual Mode**

- 949 • Type A/B shall be dimmable in both modes of operation and stated as such on the product
950 specification sheet.
- 951 • Everything from UL Type A above applies to UL Type A/B Dual Mode. All products will have a
952 note on the QPL that says: “When operated as Type A, dimmable depending on ballast
953 capability”
- 954 • Similarly, Dual Mode Lamps shall supply documentation as noted in the Type B section above
955 and will be listed on the QPL as described for Type B lamps. If the Type B lamp accomplishes
956 dimming with an external accessory, it will include a note that is specific to Type B operation.

957 **UL Type C**

- 958 • Type C lamps must meet all V3.0 controllability requirements with no further considerations.

959 **Technical Requirements Information: Screw-Base Replacements for HID Lamps**

960 Screw-base replacements for HID lamps can be generally omni-directional (the DLC defines omni-
961 directional as a product that emits radiation in all directions except in the base direction) or directional.
962 Manufacturers shall self-designate the lamp type using the “Lamp Category” field.

- 963 • In addition to beam angle, screw-base replacements for HID lamps shall report field angle during
964 the application process. This information will be displayed on the QPL.
- 965 • Screw-base replacements for HID lamps shall report intended mounting position. PPID polar
966 plots shall include tested mounting position.

967 **QPL Listing Information: All Replacement Lamps**

968 In addition to existing fields, replacement lamps will have the following information listed on the
969 Horticultural Lighting QPL:

- 970 • **“Lamp Category”**
 - 971 ○ Options include: Linear Replacement Lamp; Screw-Base Replacements for HID Lamps -
972 Omni-Directional; or Screw-Base Replacements for HID Lamps – Directional.
- 973 • **“Base Type”**
 - 974 ○ Options include: G13, G5, FA8, E39, E40.
- 975 • **“Product Size Information”**
 - 976 ○ Linear replacement lamps shall complete the following fields on the application form:
977 “Length (including pin bases)” and “diameter.” **Figure 1** shows dimensions of a typical
978 linear replacement lamp that shall be reported on the application form.

- 979 ○ Screw-base replacement lamps shall complete the following fields on the application
- 980 form: “length,” “width,” “height.” **Figure 2** shows dimensions of a typical screw-base
- 981 replacement lamp that shall be reported on the application form.
- 982 ▪ Width and height can be the same value if the lamp is round (sometimes
- 983 referred to as “corn-cob style”).
- 984 ▪ If the lamp is not round (sometimes referred to as “paddle style”), width should
- 985 be the maximum dimension perpendicular to the screw base.
- 986 • **“UL Type”**
- 987 ○ Options for Linear Replacement Lamps include: UL Type A, UL Type B, Dual Mode (UL
- 988 Type AB), UL Type C.
- 989 ○ The only option for screw-base replacements for HID lamps is UL Type B.
- 990 • **“Reported Beam Angle”**
- 991 • **“Reported Field Angle”** (Screw-Base Replacements for HID Lamps only)
- 992 • **“Intended Mounting”** (Screw-Base Replacements for HID Lamps only)
- 993 ○ Options include: horizontal, vertical, or universal.

994 **Figure 1:** Dimensions of linear replacement lamps to be reported on the application form.

997 **Figure 2:** Dimensions of screw-base replacement lamps to be reported on the application form (“corn-

998 cob style” example). If the lamp is not round, width should be the maximum dimension perpendicular to

999 the screw base.

1000

1001 **Tolerances**

1002 The DLC accepts measurement tolerances to most metrics listed in the Technical Requirements. Please
1003 refer to **Table 9** below for additional tolerance information.

1004 **Table 9: DLC Horticultural Lighting Technical Requirements Tolerances**

Parameter/Attribute/Metric	V3.0 Tolerances
Photosynthetic Photon Efficacy	-5%
Power Factor	-3 percentage points
Total Harmonic Distortion	+5 percentage points
ISTMT Temperature Measurements	1.1°C or 0.4%, whichever is greater
LM-80 Drive Current	-5%

1005 Tolerances are intended to account for all testing variation, rounding, and significant digits. The
1006 requirement values and tolerances will be interpreted by DLC review staff as exact requirements. While
1007 test labs will be expected to follow the requirements of their accreditation and relevant test standards,
1008 DLC staff will not employ additional “rounding” to interpret values below the absolute thresholds as
1009 passing. For example, if a horticultural lighting product is required to have a PPE of 2.3 with an efficacy
1010 tolerance of -5%, any value for efficacy less than 2.19 will be interpreted as a failing value. It is the
1011 applicant’s responsibility to check all data presented in an application before submission to ensure
1012 compliance with the DLC requirements.

1013 **Supporting Documentation**

1014 **Test Reports**

1015 The DLC requires that all testing be conducted at appropriately accredited laboratories except where
1016 noted otherwise. Specifically:

- 1017 • Testing of flux, intensity, and electrical characteristics shall be conducted at laboratories that are
1018 accredited to ISO 17025 and the appropriate reference test standard by accreditation bodies
1019 that are signatories to the ILAC-MRA.
 - 1020 ○ Labs conducting whole-fixture performance testing shall also follow the [DLC](#)
1021 [requirements for LM-79 labs](#).
- 1022 • Labs conducting testing of device-level and/or fixture-level photon flux maintenance shall also
1023 follow the [DLC requirements for LM-80/LM-84 labs](#).
- 1024 • Labs conducting *In-Situ Temperature Measurement Testing* (ISTMT) shall meet at least one of
1025 the following:
 - 1026 ○ Approved by OSHA as Nationally Recognized Testing Laboratories (NRTLs)

- 1027 ○ Approved through an OSHA NRTL data acceptance program or OSHA Satellite
- 1028 Notification and Acceptance Program (SNAP)
- 1029 ○ Accredited for ANSI/UL 1598 or CSA C22.2 No. 250.0-08, including Sections 19.7, 19.10-
- 1030 16, by an accreditation organization that is an ILAC-MRA Signatory

1031 **TM-33-18 Reporting**

1032 The DLC requires all applicants to submit accompanying .xml documents per ANSI/IES TM-33-18 for each
1033 parent or single product to represent the spatial and spectral distribution of the tested fixture.

- 1034 ● The .xml document shall be based on measured data from an accredited lab, accompanying the
1035 LM-79 testing requirements for spectral and spatial measurements.
- 1036 ● The .xml document shall include the spectral power distribution data, with an interval resolution
1037 of 5nm or smaller over the photosynthetic and far-red range of wavelengths defined by
1038 ANSI/ASABE S640 (400-800nm). The DLC also requires the distribution of photon flux per photon
1039 wavelengths over the PBAR range (280-800nm) in the case that applicants provide PF_{PBAR} and
1040 PE_{PBAR} data. Spectral data in 1nm intervals are acceptable. The spectral measurement represents
1041 the integrated flux in all directions from the fixture, without directional spectral information. Per
1042 TM-33-18, the data is reported in W/nm, not spectral quantum distributions. All DLC developed
1043 and interim manufacturer submitted SQD images will report in $\mu\text{mol} \times \text{s}^{-1} \times \text{nm}^{-1}$.
- 1044 ● The .xml document shall also include the photosynthetic photon intensity distribution (PPID),
1045 reported in $\mu\text{mol} \times \text{s}^{-1} \times \text{sr}^{-1}$, over the photosynthetic wavelengths defined by ANSI/ASABE S640
1046 (400-700nm). PPID is the distribution of photosynthetic photon intensity per unit solid angle
1047 leaving the fixture. Each measurement is integrated across the 400-700nm range leaving the
1048 fixture and contains no granular spectral distribution information (i.e., color over angle).
- 1049 ● TM-33 documents are separated into six elements: Version, Header, Luminaire, Equipment,
1050 Emitter, and Custom Data. In addition to all 'required' elements per TM-33-18, the following
1051 describes elements required by DLC for V3.0 compliance.
 - 1052 ○ Header Element Required Fields
 - 1053 ■ Manufacturer
 - 1054 ■ Catalog Number
 - 1055 ■ Laboratory
 - 1056 ■ Report Number
 - 1057 ■ Report Date
 - 1058 ○ Luminaire Element Required Fields
 - 1059 ■ Dimensions
 - 1060 ■ Number of Emitters
 - 1061 ○ Emitter Element Required Fields
 - 1062 ■ Quantity
 - 1063 ■ Description
 - 1064 ■ Catalog Number

- 1065 ▪ Input Wattage
- 1066 ▪ Power Factor
- 1067 ▪ Data Generation – Intensity Scaling element field shall be 'false'. Scaling with
- 1068 respect to laboratory measurements will be not accepted. Angle interpolation
- 1069 element shall be 'true' or 'false', not blank.
- 1070 ▪ Photon Data – Photon Intensity data fields shall include ONLY PPF (400-700 nm).
- 1071 Photon Flux data field shall report ONLY PPF (400-700 nm).
- 1072 ▪ Spectral Data – Spectral Intensity shall be reported. Additionally, Emitter Name
- 1073 is required for spectrally tunable products.
- 1074 ○ Custom Data Element Required Fields
- 1075 ▪ A custom data element called 'Radiant Power to PPF Scalar Multiplier' shall be
- 1076 reported for the ratio of PPF to radiant watts within the PAR range (400–700
- 1077 nm). The 'Any Data' field shall describe this scalar multiplier. Unique Identifier
- 1078 data field must contain a Universally Unique Identifier (UUID), as defined by RFC
- 1079 4122.
- 1080 • It is acceptable to report element fields described in TM-33-18 that are not detailed above. All
- 1081 data shall be reported to the number of decimal places per the [Horticultural Lighting Technical](#)
- 1082 [Requirements](#).

1083 **Additional Application Details**

1084 In addition to the test data noted in the sections above, the DLC requires the following for all
1085 submissions:

- 1086 • A completed web-based application form.
- 1087 • Specification sheets (or “cut sheets”) for the product that include maximum ambient
- 1088 temperature.
- 1089 • Specification sheets for all drivers and fans employed in the product, including lifetime-at-
- 1090 temperature information.
- 1091 • Safety certificates of compliance as issued by the relevant safety body, attested to by the DLC
- 1092 self-certification statement.
- 1093 • If demonstrating flux maintenance at the device-level, a completed TM-21 calculator shall be
- 1094 provided for each LED device present in the fixture, with the applicable LM-80 and ISTMT
- 1095 information for that LED device. If demonstrating flux maintenance at the fixture-level, a
- 1096 completed TM-28 calculator shall be provided for the fixture, with the applicable LM-84
- 1097 information accompanying it.

1098 The DLC will only accept applications for products with testing on the product submitted, with only
1099 limited variations permitted as detailed in the sections above. Given the multiple options within product
1100 families, the DLC offers the [Level 2 \(formerly Family Grouping\) Application Requirements for LED-based](#)
1101 [Horticultural Lighting](#), which describes a method to determine “worst-case” product family members.

1102 **Surveillance Testing Draft Policy**

1103 Version 3.0 Draft 1 proposes specific surveillance testing requirements to actively monitor the validity of
1104 data and other information submitted to the DLC Horticultural Lighting QPL to protect the integrity and
1105 value of the QPL for all stakeholders. The draft Horticultural Lighting Surveillance Testing Policy outlines
1106 the process for selection of products from the QPL for surveillance testing. The DLC may seek to
1107 implement additional efforts toward these objectives in future policy development cycles.

1108 Please review the draft Horticultural Lighting Surveillance Testing Policy and provide any on how the DLC
1109 should or should not monitor the validity of QPL listed products.
