

DLC TECHNICAL REQUIREMENTS
FOR LIGHTING CONTROLS SYSTEMS

NLC V5.2

DRAFT 1
RELEASED MARCH 30, 2026

About this Document

This version of the Technical Requirements document contains updates and clarifications made to the previously released **NLC5.1** document. These updates are denoted by yellow highlighted line numbers or table rows.

This document defines requirements to be met and capabilities to be reported for lighting control systems listed on the DesignLights Consortium (DLC) [Networked Lighting Controls Qualified Products List \(QPL\)](#).

 - 4.2. Policy Clarifications and Updates 26

1 Introduction

The DesignLights Consortium (DLC) is committed to providing decision makers with data and resources on quality lighting, controls, and integrated building systems to reduce energy use, carbon emissions and light pollution. Through the [Networked Lighting Controls \(NLC\) Qualified Products List \(QPL\)](#) and its technical requirements, the DLC helps efficiency programs, manufacturers, specifiers, and building owners identify NLC systems that provide reliable performance, security, and measurable energy impacts.

With each new version of the technical requirements, the DLC has worked closely with manufacturers, utilities, researchers, and other stakeholders to ensure that the NLC program continues to reflect both technological progress and real-world deployment experience. Previously, the DLC updated the technical requirements to support interoperability, energy reporting, and integration with other building systems, helping align the NLC program with broader trends toward connected and data-enabled building infrastructure.

Version 5.2 of the NLC Technical Requirements focuses on these goals:

- 1) Highlight emerging capabilities in networked lighting controls
 - Present new system capabilities, particularly integrations with thermostats to save energy and improve building performance
- 2) Strengthen the role of NLC in energy efficiency programs by:
 - Improving confidence in savings through standardization configuration reporting (ANSI/NEMA C137.9)
 - Creating a clear pathway for first generation LED projects to achieve deeper savings through NLC upgrades
- 3) Simplify and improve the QPL experience
 - Streamline capability descriptions and enhance usability so stakeholders can more easily understand, compare, and select qualified systems
- 4) Improve visibility across connected product categories
 - Create stronger linkages between NLC systems and SSL products to support clearer specification pathways and coordinate system design

Together, these changes reinforce the role of networked lighting controls as a foundation for integrated building controls and deeper energy savings across building systems. The DLC has also created the [NLC-HVAC Integration Toolkit](#), which provides a framework and case studies to pursue successful, energy-saving integration projects.

35 Additionally, to support opportunities in horticulture energy efficiency programs, language
36 has been added to allow horticultural control systems that meet these requirements to be
37 listed on the NLC QPL.

38

39

40

41

42 2 Scope of Technical Requirements

43 These are requirements for NLC systems associated with commercial and industrial
44 buildings, roadways, and outdoor environments. An NLC system is defined for the
45 purposes of these requirements as a collection of interconnected devices that enable the
46 implementation of lighting control strategies such as individual addressability, continuous
47 dimming, high end trim, occupancy sensing, daylight harvest and scene control, etc.

48 Luminaires, retrofit kits, and lamps are qualified separately by the DLC's [Solid-State](#)
49 [Lighting/LED \(SSL\) Technical Requirements](#) and [Qualified Products List](#). While the NLC
50 technical requirements apply at the system level, the SSL technical requirements apply to
51 integral luminaire controls. These requirements are non-overlapping and complementary,
52 meaning NLC manufacturers do not need to qualify their systems under SSL.

53 DC and PoE networked lighting control systems are eligible to be qualified, in conjunction
54 with the [SSL Testing and Reporting Requirements for DC and PoE Lamps, Luminaires, and](#)
55 [Retrofit Kits](#).

56 Building management systems and horticultural control systems that control networked
57 lighting plus other building systems, such as HVAC, are eligible to be qualified as NLC
58 systems and listed on the QPL, provided they meet all the DLC's requirements for NLC.
59 Note that the DLC does not claim to qualify any HVAC-specific or horticultural-specific
60 capabilities of these systems at this time. Please see our [Hort QPL](#) for qualified luminaires
61 and lamps for horticulture.

62 2.1. Indoor and Outdoor System Scopes

63 Different NLC systems are appropriate for different uses based on their capabilities. Each
64 QPL-listed NLC system will qualify for one or more System Scopes, based on its
65 capabilities, as listed below.

66 *Indoor Systems*

67 The DLC NLC QPL reports on the following System Scopes for indoor systems:

- 68 • Room or Zone
- 69 • Whole Building
- 70 • Portfolio/Enterprise
- 71 • Structured Parking

72 *Room or Zone*: This phrase indicates a “room-based system”, defined by the DLC as a
73 system that is designed to control lighting in a single room or zone, and where the control,
74 configuration and management of the system is contained within the room or space
75 illuminated by the system. In order to interact with the system (for instance, to change any
76 settings or to download any data), a user must be physically present in or in close proximity
77 to the room or space illuminated by the system.

78 *A Whole Building system* provides a centralized dashboard for energy monitoring and scene
79 control across multiple rooms or zones within a single building. This dashboard could be
80 implemented by various means such as one or more gateways, a local server, a cloud
81 server, or a mobile app.

82 *A Portfolio/Enterprise system* provides a centralized dashboard for energy monitoring and
83 scene control across multiple sites (such as multiple buildings across a college campus or
84 multiple stores of a retail franchise).

85 *Indoor or Outdoor Systems with Weatherproof Equipment*

86 The *Structured Parking* scope can apply to either indoor or outdoor systems that meet the
87 indoor or outdoor requirements with weatherproof equipment.

88 *Outdoor Systems*

89 The DLC NLC QPL reports on the following *System Scopes* for outdoor systems:

- 90 • Structured Parking
- 91 • Area/Building Outdoor/Parking
- 92 • Streetlight (Residential Streets)
- 93 • Roadway (Highways)

94 The *Area/Building Outdoor/Parking* scope is intended for systems designed to control
95 lighting installed in the environments surrounding a building.

96 The *Streetlight (Residential Streets)* scope is intended for systems designed to control
97 outdoor lighting installed at the municipal scale.

98 The *Roadway (Highways)* scope is intended for systems designed to control outdoor
99 lighting installed for high-speed limited access highways.

100

101 **2.2. Definition of Required Versus Reported Capabilities**

102 The Technical Requirements are built on **required** and **reported** system capabilities.

103 **Required Capabilities:** Required capabilities must be available in all systems to be listed
104 on the QPL. Systems that do not offer these capabilities are not eligible to be listed. A
105 successful application will provide information on the availability of these capabilities and
106 characteristics. Key information provided by the manufacturer will be published on the
107 QPL.

108 *Note:* While the DLC requires systems to offer certain capabilities, the DLC does not
109 specify whether a particular capability must be installed on a project. For example, while
110 the DLC requires systems to have daylight harvesting/photocell capability, the DLC does
111 not specify which rooms or luminaires on a project must be installed with daylight
112 harvesting/photocell capability. Project-specific requirements for rebates and incentives
113 are determined by individual efficiency programs.

114 **Reported Capabilities:** The DLC reports on the presence or absence of, type, and/or
115 characteristics of each reported capability for qualified systems. While systems are not
116 required to include these capabilities, a successful application will provide information on
117 the presence or absence of these capabilities and their characteristics. Key information
118 provided by the manufacturer will be published on the QPL.

119

3 NLC Requirements

Some capabilities are required for Indoor systems but reported for Outdoor systems, and vice versa, as shown in **Tables 2 and 3**. While this section is loosely organized with required capabilities first, followed by reported capabilities, that organization is not precise due to variations between indoor and outdoor requirements.

3.1. Requirements Other Than Control Capabilities

Table 1 describes requirements for all DLC-qualified NLC systems, beyond the control capabilities summarized in **Tables 2 and 3**. The complete qualification process is described [here](#).

Table 1. Requirements Other Than Control Capabilities

Row	Requirement	Definition
1	Customer Available Information	<p>For an applicant to claim a capability listed in Tables 2 and 3, the manufacturer’s customer literature must specify that the system has the capability, with instructions for how to configure and/or use this feature.</p> <p><i>Customer available</i> means the documentation is for a finished product available publicly on a website, and/or included with the product packaging, and/or provided to the customer upon request. It cannot be a document produced for the sole purpose of obtaining DLC qualification without further use or availability for customers. The DLC reserves the right to accept, reject, or require changes to documentation to satisfy this requirement.</p> <p>Any documentation provided to the DLC will be used for the purpose of verifying compliance with the DLC Technical Requirements and will not be made available or distributed publicly.</p> <p>The following capabilities from Tables 2 and 3 are exempt from this requirement because their functionality does not depend on operator understanding:</p> <ul style="list-style-type: none"> • Continuous Dimming • Individual Addressability • Luminaire Level Lighting Control (LLLC, embedded) • Networking • Ease of Implementation • Type of User Interface • Cybersecurity • Control Persistence

Row	Requirement	Definition
2	Warranty	<p>The DLC requires a minimum warranty of five years for all components of the system addressed by the requirements, except for software, on-premises computer server(s), and cloud service.</p> <p>An optional warranty extension to five years is acceptable for meeting this requirement; however, the NLC QPL will indicate that an extended warranty must be purchased to meet the requirements.</p>
3	Commercial Availability and Verification	<p>Before they can be listed, all systems must be fully commercially available in the U.S. and/or Canada, must be able to be purchased, and must have complete, final documentation and literature readily available on the manufacturer’s website or available to the customer upon request, as described in Row 1, “Customer Available Information”.</p> <p>The DLC requires that a qualified system has been installed and operated successfully in at least one actual field installation at a third-party site (not occupied by the applicant or an agent of the applicant). The DLC will verify this through a case study and/or a customer reference. The facility may be of any size where all the DLC-required capabilities are functional. Multiple sites may be used. For instance, occupancy sensing may be implemented at one site and high-end trim at another. If daylight harvesting is not available at a third-party site, then it may be demonstrated in a live webinar in an installation at a building owned by the manufacturer. Daylight harvesting is the only DLC-required capability eligible for this exception.</p> <p>Manufacturers of private label systems may submit an application two weeks before the system is launched. This approach requires the private label applicant to submit a letter of intent (template available here) during the application submission process confirming that the system will be launched within two weeks. When the system is commercially available, the applicant must notify the DLC at info@designlights.org. If the system is not yet commercially available after the two-week launch window, it will be temporarily delisted from the NLC QPL until it has been launched.</p>
4	System Overview Presentation	<p>As part of the application review process, the DLC requires a system overview to be presented via webinar or in-person to the DLC. (See the application form for more information.) This requirement may be waived or shortened for annual re-listings of a previously qualified system for which a recording of a prior presentation is available, and the system has not changed extensively.</p>

Row	Requirement	Definition
5	Case Study, Customer Interview	<p>The DLC requires a case study or a customer reference for a field site where the NLC system has been installed. The DLC may contact the referenced customer to verify all DLC-required capabilities of the system.</p> <p>The site may not be an office of the manufacturer or a business partner directly connected to the applicant, such as a lighting sales representative. The DLC wishes to confirm with an unbiased third party that the system has been installed and operated successfully in at least one actual field installation. This contact information will not be shared with any other parties.</p> <p><i>Note:</i> The Customer Interview is required only for new OEM applications.</p>

130

131 **3.2. Requirements for Indoor Lighting Systems**

132 **Table 2** summarizes required and reported system capabilities for indoor lighting systems.

133 **Table 2: Required and Reported Capabilities for Indoor Lighting Systems**

Required Indoor System Capabilities	Reported Indoor System Capabilities
Networking of Luminaires and Devices	Type of User Interface
Individual Addressability	Luminaire Level Lighting Control (LLLC, integrated)
Zoning	Control Persistence
Continuous Dimming	Scheduling
Cybersecurity	Energy Monitoring (room-based systems)
Occupancy Sensing	Personal Control
Daylight Harvesting/Photocell Control	Scene Control
High-End Trim	Plug Load Control
Energy Monitoring (except room-based systems)	Load Shedding/Demand Response
	External Systems Integration
	Configuration Reporting
	Emergency Lighting
	Device Monitoring/Remote Diagnostics

Color Changing/Tuning

134 **3.3. Requirements for Outdoor Lighting Systems**

135 **Table 3** summarizes required and reported system capabilities for outdoor lighting
136 systems.

137 **Table 3: Required and Reported Capabilities for Outdoor Lighting Systems**

Required Outdoor System Capabilities	Reported Outdoor System Capabilities
Networking of Luminaires and Devices	Type of User Interface
Individual Addressability	Luminaire Level Lighting Control (LLLC, integrated)
Zoning	Control Persistence
Continuous Dimming	Scene Control
Cybersecurity	Load Shedding/Demand Response
Occupancy Sensing AND/OR Traffic Sensing	External Systems Integration
Daylight Harvesting/Photocell Control	Emergency Lighting
High-End Trim	Device Monitoring/Remote Diagnostics
Scheduling	Color Changing/Tuning
Energy Monitoring	

138

139 **3.4. Capability Requirement Definitions**

140 This section provides a definition of each capability. These capabilities apply to both Indoor
141 and Outdoor systems, except where noted. If an applicant answers ‘yes’ to a capability
142 definition, that capability can be claimed. If an applicant answers ‘no’, then the capability
143 cannot be claimed. The DLC NLC application form specifies in more detail the information
144 the DLC asks about each capability and the information that will be published on the QPL.
145 Beyond the basic definitions shown here, the DLC NLC application contains additional
146 questions about most capabilities. After answering ‘yes’ to the first key question about a
147 capability, an applicant can answer additional questions about that capability with any
148 well-documented response.

149 *Note:* Some NLC systems control luminaires and retrofit kits and some NLC systems
150 control lamps within luminaires. The latter systems use a wireless controller integrated
151 inside each lamp. The “luminaires/lamps” phrase indicates that a requirement applies to
152 luminaires and retrofit kits if an NLC system controls luminaires and retrofit kits, and the
153 requirement applies to lamps if an NLC system controls lamps.

154 **3.4.0. Networking of Luminaires and Devices**

155 The capability of individual luminaires/lamps and control devices to exchange digital data
156 with other luminaires/lamps and control devices on the system. This capability is required
157 at the room, space, or area level, but not at the whole building level or beyond (e.g. non-
158 lighting systems, or the internet).

159 **3.4.1. Type of User Interface**

160 The type of interface provided by the control system for users to read and adjust control
161 system settings during system start-up, commissioning, and/or ongoing operation.

162 **3.4.2. Individual Addressability**

163 The ability to communicate digitally and uniquely with each individual luminaire/lamp,
164 sensor, controller and user interface device in the lighting system, allowing for software-
165 controlled configuration and re-configuration of devices and control zones independent of
166 electrical circuiting.

167 **3.4.3. Zoning**

168 The capability to group luminaires/lamps and form unique lighting control zones for a
169 control strategy via software-defined means, and not via physical configuration of
170 mechanical or electrical installation details (e.g. wiring).

171 **Indoor:** Zoning is required for occupancy sensing, high-end trim and daylight harvesting
172 control strategies except for systems that feature luminaire level lighting control (LLLC)
173 capabilities as defined in these requirements under “Reported Capabilities”, in which case
174 zoning is only required for occupancy sensing and high-end trim control strategies.

175 **Outdoor:** Zoning is required for high-end trim.

176 **3.4.4. Continuous Dimming**

177 The capability of a control system to provide control with sufficient resolution in output
178 (100+ steps) to support light level changes perceived as smooth (as opposed to step
179 dimming with a small number of discrete light levels). At least one user interface needs to
180 support continuous dimming, but not every user interface needs to have that capability.

181 **3.4.5. Cybersecurity**

182 Cybersecurity is required for all qualified NLC systems. While the standards in **Table CS-1**
183 and services in **Table CS-2** can be applied to NLCs, not all their requirements may be
184 relevant for various applications of lighting control systems. Manufacturers and their
185 certification bodies should review each option to identify the appropriate requirements for
186 each system being qualified, and customers should select product requirements based on
187 the risk profile of each project.

188 To claim the cybersecurity capability, a system must, at the time of qualification, have a
189 valid certification for one or more of the specified standards in **Table CS-1** or services in
190 **Table CS-2**.

191 The list of applicable standards in **Table CS-1** and services in **Table CS-2** will be reviewed
192 for each incremental revision to the Technical Requirements, or annually, whichever comes
193 sooner. Applications referring to a potential new standard or service will only be accepted
194 for review after the new standard or service has been vetted and an updated set of
195 Technical Requirements has been published. The addition of a new standard or service
196 may only warrant a minor Technical Requirements dated update.

197 Certification in any one of the four categories of **Table CS-1** (Process, Components,
198 System, Cloud Services) is sufficient.

199 **Table CS-3** describes how DLC reviewers will confirm compliance.

200 The DLC will confirm that cybersecurity certification will be valid for at least 12 months
201 after the time of application submission. If the certification will expire within a year, the
202 NLC manufacturer must submit a letter of intention of renewal with the application and
203 must provide an updated certificate upon its expiration, in compliance **with Table CS-2 or**
204 **CS-3**, to avoid being delisted.

205 The DLC will confirm cybersecurity certification once a year in July. If a certificate has
206 lapsed, a system must be recertified to avoid being delisted.

207 Some cybersecurity certifications offer different levels of compliance based on risk
208 management. For instance, some standards offer lower performance requirements for
209 room level systems that cannot be upgraded to add a permanent internet connection.
210 Therefore, the DLC cybersecurity requirement applies to all systems—with the
211 understanding that comprehensive systems with many capabilities are subject to more
212 rigor, compared to simple systems with few capabilities.

213 *Cybersecurity Standards Definitions:*

- 214 • **Cloud Services:** Standards for cloud services that address secure integration with
215 services from a remote cloud computing provider.
- 216 • **Components:** Standards that address the cybersecurity of each individual physical
217 end device in a networked system.
- 218 • **Cybersecurity:** The practice of defending networked systems and data from
219 malicious attacks.
- 220 • **Process:** Standards that address the development process in order to reduce the
221 number of cybersecurity vulnerabilities designed into components, systems and
222 services, and that manifest over the product lifecycle.
- 223 • **System:** Standards that address the networked system, including aspects such as
224 authentication, data confidentiality, system integrity, service availability, protocol
225 converters, firewalls, gateways, web servers and web services interfaces.

226 *Criteria for Acceptable Cybersecurity Standards:*

227 The DLC recognizes the cybersecurity standards listed in **Table CS-1** that meet criteria 1-3
228 below, and the cybersecurity services listed in **Table CS-2** that meet criteria 2-3 below:

- 229 1. Certifiable with a methodology established through one of the following:
 - 230 a. A voluntary consensus process such as ANSI, ISO, IEC, etc.
 - 231 b. A federal agency of the USA or Canada
 - 232 c. A collaborative multi-stakeholder engagement process such as the Cloud Security
233 Alliance
- 234 2. Applies to one or more of the following:
 - 235 a. Product development process lifecycle
 - 236 b. Components/embedded devices
 - 237 c. System
 - 238 d. Cloud services
- 239 3. Includes at least three of the following technical content, for 2.b, 2.c, and/or 2.d above:
 - 240 a. Penetration testing
 - 241 b. Communication robustness testing
 - 242 c. Vulnerability identification testing
 - 243 d. Multiple levels of security
 - 244 e. Root of Trust with trusted boot and secure storage of encrypted data
 - 245 f. Assessment by accredited entity

246 *List of Certifications:*

247 Cybersecurity standards and cybersecurity services that meet the criteria listed above are
248 shown in **Tables CS-1 and CS-2**, respectively. Once a certification (i.e., a standard or a

249 service) is listed here, the DLC does not expect to remove it with less than two years’
 250 notice.

251 As new cybersecurity standards and/or certification pathways become available, the DLC
 252 will evaluate them and update these tables accordingly.

253 **Table CS-1: Cybersecurity Standards Recognized by the DLC**

Standard	Process	Components/ Embedded Devices	System	Cloud Services
ANSI/UL 2900-1	y	y		
ANSI/ISA/IEC 62443	62443-4-1	62443-4-2	62443-3-3	
SOC 2	y		y	y
ISO 27001	y			
ISO 27017 (with 27001)				y
FedRAMP				y
CSA STAR				y
ioXt		y	y	y
PSA Certified		y	y	
CSA/ANSI T200	y	y	y	

254

255 **Table CS-2: Cybersecurity Services Recognized by the DLC**

Service	Proof of Compliance
UL IoT Security Rating (UL 1376)	Copy of certificate or letter from UL
Intertek Cyber Assured	Copy of certificate or letter from Intertek

256

257

258 **Table CS-3: Proof of Cybersecurity Standard Compliance**

Standard	Proof of Compliance
ANSI/UL 2900-1	Certification claim listed on applicant’s website, plus a compliance letter or copy of certificate issued by an accredited certification body.
IEC 62443	ISASecure registry of a component, system or Certified Development Organization at https://isasecure.org/end-users , or Copy of IECEE certificate or listed at https://certificates.iecee.org/ods/cb_hm.xsp , or Copy of certificate from another accredited agency, such as UL, VDE, DEKRA, etc.
SOC 2	Certification claim listed on applicant’s website, plus a compliance letter from third-party auditor.
ISO 27001	Copy of an accredited certification from a member of the ANSI-ASQ National Accreditation Board, as listed at http://anabdirectory.remoteauditor.com , or Copy of an accredited certification from an organization accredited as “Management Systems Certification Bodies” for ISO 27001 by the International Accreditation Service (IAS) at https://www.iasonline.org/search-accredited-organizations-2
ISO 27017 (with 27001)	Copy of an accredited certification from a member of the ANSI-ASQ National Accreditation Board, as listed at http://anabdirectory.remoteauditor.com
FedRAMP	“Authorized” at https://marketplace.fedramp.gov/products
CSA STAR	“Certification” or “Attestation” at https://cloudsecurityalliance.org/star/registry
ioXt	Copy of ioXt certificate or letter from accredited testing organization or certified at https://compliance.ioxtalliance.org/products
PSA Certified	Listed at https://www.psacertified.org/certified-products
CSA/ANSI T200	Certification claim listed on applicant’s website, plus a compliance letter or copy of certificate from CSA or from an accredited lab, along with a copy of a letter of accreditation from CSA.

259 *Renewal is required at least every three years for a certificate to remain valid.*

260 **3.4.6. Occupancy Sensing**

261 The capability to affect the operation of lighting equipment based upon detecting the
262 presence or absence of people in a space or outdoor environment.

263 Outdoor systems must include either occupancy sensing or traffic sensing. They may
264 include both, but that is not required.

265 **3.4.7. Traffic Sensing**

266 The capability to affect the operation of lighting equipment based upon detecting the
267 presence or absence of people in a space or outdoor environment.

268 Outdoor systems must include either occupancy sensing or traffic sensing. They may
269 include both, but that is not required.

270 **3.4.8. High-End Trim***

271 The capability to set the maximum light output to a less-than-maximum state of an
272 individual luminaire/lamp or group of luminaires/lamps at the time of installation or
273 commissioning. High-end trim must be field reconfigurable. This capability is distinct from
274 automatic compensation for lumen depreciation, which automatically increases output as
275 a system operates over time.

276 *While the DLC specifically requires “High-end trim”, some manufacturers refer to this
277 capability as “task tuning” or “tuning” within their system interfaces. Refer to [NEMA LSD](#)
278 [64-2014](#) for definitions of lighting controls terminology.

279 **3.4.9. Daylight Harvesting / Photocell Control**

280 The capability to automatically affect the operation of lighting or other equipment based on
281 the amount of daylight and/or ambient light that is present in a space, area or outdoor
282 environment. This capability is typically called daylight harvesting for indoor systems, and
283 photocell control for outdoor systems.

284 **3.4.10. Scheduling**

285 A control strategy that controls lighting, equipment or systems based on time of day or
286 astronomical event - for example, scheduling building lighting to be automatically turned
287 off at 6 p.m. or at sunset. Scheduling capability is reported for indoor systems and required
288 for outdoor systems. Outdoor systems are required to have time-based scheduling, and
289 "astronomical" scheduling functionality for sunrise and sunset programming, based on
290 geographical location and time of year.

291 **3.4.11. Energy Monitoring**

292 The capability of a system to report the energy consumption of a luminaire/lamp and/or a
293 group of luminaires/lamps. The basic capability of energy monitoring is required, with an
294 exception for room-based systems.

295 Detailed description:

- 296 • Individual luminaire/lamp monitoring, as well as energy monitoring on dedicated
297 lighting circuits is acceptable.
- 298 • The method by which the system implements this capability must be clearly
299 described, including whether the system provides automated energy measurement
300 or relies on numerical manual input during system setup for accurate measurement
301 (such as inputting the wattage of each luminaire/lamp in a project).
- 302 • Reference verified by DLC consists of one or both of:
 - 303 ○ Sample .CSV file with documentation
 - 304 ○ API documentation
- 305 • The basic, required capability of energy monitoring is aligned with ASHRAE 90.1-
306 2016 Section 8.4.3. as follows:
 - 307 ○ Energy use by indoor lighting (if applicable), outdoor lighting (if applicable)
308 and receptacle circuits (if monitored by the NLC) can be monitored
309 independently.
 - 310 ○ For buildings with tenants, the data for each tenant space can be reported to
311 each tenant.
 - 312 ○ Energy use data can be transmitted to a building control system (if present)
313 and graphically displayed.
 - 314 ○ The lighting system energy use can be recorded and stored in either of the
315 two ways described below.
 - 316 ■ Data is recorded at least once every 15 minutes and reported at least
317 hourly, daily, monthly and annually, or recorded and reported upon
318 state change, with data stored for at least 24 months;
319 or
 - 320 ■ At any time during the first year after original configuration, the
321 preceding four weeks of 15-minute interval data can be reported, and
322 daily interval data can be reported since the date of original
323 configuration.
- 324 • Lighting system energy data is reported by the NLC and can be shared electronically
325 (automatically or manually generated email) with authorized entities. For example,
326 utility energy efficiency programs for NLCs can receive the energy data to verify

327 energy savings. The lighting energy data may also be accessed for central display of
328 facility energy end-use status or for a building portfolio management provider to
329 benchmark energy performance. Note that the recommended best practice for
330 energy data accuracy is described in ANSI C137.5. “Energy Reporting Requirements
331 for Lighting Devices”.

332
333 **The energy monitoring capability is not required for room-based systems.** A “room-
334 based system” is defined in the **System Scopes section above**. In order for a system to
335 qualify for this exemption, the DLC review process must confirm that the product
336 claims only “Room or Zone” for indoor scope as listed on the DLC QPL; and that, if a
337 room-based system is capable of being upgraded with an internet connection, the
338 upgraded system must meet all of the required capabilities of the Technical
339 Requirements and be listed on the QPL.

340
341 In order for room-based systems to claim the optional energy monitoring capability:
342

- Energy data can be retrieved by a user in the room when required - hourly,
343 daily, monthly or yearly, or on demand; and
- Energy data can be retrieved in the form of a CSV file and/or API.

345 **3.4.12. Luminaire Level Lighting Control (LLLC, integrated)**

346 NLC V5.2 Technical Requirements are now aligned with the recent release of DLC SSL V6.0
347 Technical Requirements, which clarified control capabilities relevant to LLLC functionality.
348 The DLC SSL QPL will be updated with new control capability information by Dec. 15, 2026.

349 NLC V5.2 Technical Requirements address the NLC system capability for LLLC. SSL V6.0
350 addresses the luminaire and integrated control components that enable the LLLC
351 capability to function in a lighting system.

352 LLLC is defined as the capability to have a networked occupancy sensor, ambient light
353 sensor and high-end trim installed for each luminaire/kit/lamp and directly integrated or
354 embedded into the form factor during the manufacturing process.

355 In addition to these required integrated components, LLLC systems must have control
356 persistence capability as described in this document.

357 To demonstrate commercial availability of the integrated component options, at least one
358 family, luminaire or kit with integrated control must be verified by the DLC. Manufacturers
359 may choose whether to list this information publicly on the QPL.

360

361 **3.4.13. Control Persistence**

362 The capability of a networked lighting control system’s lowest-level (“edge device”)
363 luminaire/lamp controllers to execute three energy saving strategies (occupancy sensing,
364 daylight harvesting and high-end trim) at a room-level or finer resolution in the absence of
365 communications with the next higher networked element in the system’s topology.

366 **3.4.14. Personal Control**

367 The capability for individual users to adjust to their personal preferences, via networked
368 means, the illuminated environment of a light fixture or group of light fixtures in a specific
369 task area. The publicly available information must clearly describe a control interface for
370 use by a single individual who does not have access to system-wide settings.

371 A wireless dimmer switch may only be considered a personal control interface if product
372 documentation:

- 373 • Shows that the physical configuration is suitable for workstation use (i.e., a small,
374 self-contained unit without any external wiring, suitable for use as a handheld
375 remote control); and
- 376 • Describes configuration for personal control within a larger area.

377 A software-based interface may only be considered personal control if product
378 documentation:

- 379 • Shows it provides a specific interface intended for personal control by an individual
380 user within a subsection of a larger space; and
- 381 • The interface only allows access to personal control functions for the light fixtures in
382 the specific areas being controlled (i.e., each occupant can control their own area,
383 but not their neighbors' areas).

384 **3.4.15. Scene Control**

385 The capability of a system to provide two or more pre-programmed light level settings for a
386 group or multiple groups of luminaires to suit multiple activities in a space and allow for
387 recall of these settings via a switch, control device or signal from a BMS or API.

388 **3.4.16. Plug Load Control**

389 The capability to control the power delivered to receptacles through scheduling or
390 occupancy sensing. The method by which the system implements this capability must be
391 clearly described in the publicly available reference(s).

392 **3.4.17. Load Shedding/ Demand Response**

393 The capability to reduce the energy consumption of a lighting system in a pre-defined way
394 on a temporary basis, in response to a demand response signal without manual
395 intervention. The method by which the system implements this capability (managed by
396 NLC and/or BMS) must be clearly described in the publicly available reference(s). The
397 method for pre-defining the system behavior for temporary load reduction must be
398 accessible through a user interface. The data the NLC can receive and interpret from other
399 networked systems must include at least a signal that can be used for purposes such as
400 LS/DR.

401 *Basic/one-way:* A demand response signal is received by an NLC system, and the energy
402 consumption of the system is reduced in a pre-defined way on a temporary basis, without
403 manual intervention.

404 *Advanced/two-way:* A control feedback loop and communication is established between a
405 building’s demand response server and a demand control originator (such as a grid
406 operator, energy provider, microgrid or onsite Distributed Energy Resource), so that the
407 building modifies its real-time energy consumption in response to the originator’s needs
408 and reports the results to the originator. The NLC participates in this ecosystem as one of
409 the load-responding building systems.

410 *Reporting:*

411 Examples of data about communication for LS/DR in the DLC database include power data
412 availability, granularity and accuracy, as well as supported versions of OpenADR.

413 **3.4.18. External Systems Integration (e.g. BMS, EMS, HVAC, Lighting, API,
414 Cloud)**

415 The capability to exchange data with other networked systems such as building or energy
416 management systems (BMS/EMS), heating ventilation and air conditioning (HVAC) systems
417 or other lighting and building systems via BACnet, Modbus, LonWorks or other open
418 protocols, application program interface (API) or other methods. To claim this **reported**
419 capability, the data available from the NLC for exchange with other networked systems
420 must include occupancy status at the zone, space or area level, and energy data at the
421 zone-, circuit- or system-level. The data the NLC can receive and interpret from other
422 networked systems must be digital, and able to be used for purposes such as scene
423 control, zones, groups, areas, regions and/or presets. The method, including formats and
424 languages, by which the system implements this capability must be clearly described in
425 the publicly available reference(s).

426 **NLC-integrated Thermostats**

427 Thermostats are now available that can easily integrate with an NLC system to receive
 428 digital occupancy data from the NLC system. Within the External Systems Integration
 429 capability, the DLC recognizes NLC systems that support these thermostats, as shown in
 430 **Table TH-1**. The thermostat information shall be submitted by the NLC manufacturer as
 431 part of the application process.

432 Note: Detailed questions about most capabilities are not included in this document.
 433 However, since integrated thermostats are a new topic for the DLC, **Table TH-1** is included
 434 here, to benefit from the public comment process.

435 **Table TH-1: Thermostats recognized by the DLC**

Row	Question	Acceptable Answer(s)
1	Name of the thermostat manufacturer, model name and model number?	Provide info
2	Does the thermostat receive and respond to digital occupied/unoccupied data by changing temperature setpoints and fan control?	Yes
3	Can thermostat-NLC integration be configured by GUI, without writing code?	Yes
4	Can the thermostat be configured by GUI to subscribe to occupancy data from multiple occupancy sensors?	Yes
5	Can the GUI display zones for lighting and for HVAC together, overlaid on a single floorplan?	Yes
6	Can the thermostat receive data for partial occupancy and respond appropriately? For example, a thermostat controls a space with 10 occupancy sensors, one of which currently indicates 'occupied'. This indicates 10% partial occupancy. Can the thermostat respond differently, versus data indicating complete vacancy or full occupancy?	Yes or No
7	Does lighting-thermostat integration require a gateway?	Yes or No
8	Can lighting and thermostat be scheduled together on one GUI display, with offset(s) for thermal inertia?	Yes or No
9	Are the primary thermostat terminal designations RGYW?	Yes or No
10	In addition to digital occupancy data, can the thermostat also accept 24VAC wired occupancy input?	Yes or No
11	What digital protocol(s) is used to transfer occupancy data between the thermostat and NLC system (or gateway if used)? Bluetooth NLC, EnOcean, Zigbee 3.0, Zigbee 4.0, other	Choose all that apply
12	Besides occupancy, what additional data can the NLC transfer to the thermostat, configured by GUI without writing code?	Choose all that apply

	none, humidity, CO2, particulates, pressure, other	
13	What GUI type(s) are supported? mobile app, web browser, wallstation	Choose all that apply

436

437 **Key Questions on NLC-Integrated Thermostats**

438 **Key Question 1:** Row 3 of **Table TH-1** asks, “Can thermostat-NLC integration be configured
439 by GUI, without writing code?” The intent of the language “without writing code” is to
440 separate systems that can be integrated with automated handshakes vs systems that
441 require advanced customization by a third-party integrator or factory representative. Is the
442 current language “without writing code” sufficiently clear, or is there other language that
443 could indicate this distinction in a more precise way without sacrificing brevity?

444

445 **Key Question 2:** Row 5 of **Table TH-1** asks, “Can the GUI display zones for lighting and for
446 HVAC together, overlaid on a single floorplan?” The intent of the question is to speak to the
447 ease of use of the GUI and whether a user can interact with the GUI in an intuitive manner
448 without receiving technical training. Is the current language sufficiently clear, or is there a
449 less prescriptive way to specify the desired result - that lighting and HVAC zones can be
450 easily matched with a GUI, in a manner that can be unambiguously confirmed or denied?

451

452 **Key Question 3:** (Similar to Key Question 1) Row 12 of **Table TH-1** asks, “Besides
453 occupancy, what additional data can the NLC transfer to the thermostat, configured by GUI
454 without writing code?” The intent of the language “without writing code” is to separate
455 systems that can be integrated with automated handshakes vs systems that may require
456 advanced customization by a third-party integrator or factory representative. Is the current
457 language “without writing code” sufficiently clear, or is there other language that could
458 indicate this distinction in a more precise way without sacrificing brevity?

459

460 **3.4.19. Configuration Reporting**

461 The capability of an NLC system to produce NEMA/ANSI C137.9 compliant NLC
462 configuration reports.

463 **3.4.20. Emergency Lighting**

464 Publicly available documentation illustrating how a system’s luminaires connect with an
465 emergency power source.

466 The QPL will provide the URL(s) for online documentation provided by manufacturers for
467 system designers to refer to. This documentation will identify wiring diagrams, required
468 components and/or application guides needed to understand design considerations for
469 integrating the system into an emergency lighting system.

470 **3.4.21. Device Monitoring / Remote Diagnostics**

471 The capability to monitor, diagnose and report operational performance including system
472 and/or component failures.

473 **3.4.22. Color Changing / Tuning**

474 The capability to alter the output and color of tunable white and/or variable color output
475 luminaires via a dedicated control interface(s). To demonstrate compliance with this
476 capability, the interface(s) must be clearly described in the product literature and allow for
477 at least two CCT settings. These settings may be described in terms of CCT, such as 3000K
478 or 5000K, or simple descriptive terms for the desired setting such as 'Night' or 'Day'. The
479 product literature must also specify installation and configuration requirements to
480 implement this functionality.

481

4 Policy Clarifications and Updates

482

4.1. Schedule of Revisions

Revision	Date	Description
1.0	Apr. 21, 2016	Initial Technical Requirements published.
1.01	May 7, 2016	Clarified that the Technical Requirements are for indoor control systems. Systems designed and marketed exclusively for outdoor applications are not eligible to be qualified.
1.02	Feb. 24, 2017	Clarified that the Technical Requirements do not cover DC or PoE systems.
2.0	Jun. 1, 2017	Version 2.0 published, with addition of outdoor control systems.
3.0	Jun. 1, 2018	Version 3.0 published, with addition of DC/PoE systems, scenes, and multi-year plans for energy monitoring and cybersecurity.
4.0	Jun. 10, 2019	Version 4.0 published, with addition of energy monitoring requirement, and criteria for cybersecurity certifications and building management systems capable of networked lighting control.
5.0	Jun. 23, 2020	NLC5 published, with addition of cybersecurity requirement. Energy monitoring definition aligned with ASHRAE 90.1-2016. Three capabilities labeled as supporting Interoperability.
5.1	June 28, 2024	NLC5.1 published with updated criteria for acceptable cybersecurity standards and services, and new section on NLC Primary Use Designations. The words “Interior” and “Exterior” were changed to “Indoor” and “Outdoor” to align with other DLC documents.
5.2		NLC V5.2 published to recognize NLC systems that support thermostat integration, and systems that support the ANSI/NEMA C137.9 configuration reporting standard. LLLC systems can now be associated with an LLLC luminaire/kit listed under SSL V6.0 on the DLC SSL QPL. The document format was updated to consolidate capability descriptions; the term “Primary Use Designation” was changed to “System Scope” to align with the NLC QPL; and a reference to ANSI NEMA C137.5 was added to the Energy Monitoring recommendations. Added language to support the qualification of horticultural control systems.

483

484 **4.2. Policy Clarifications and Updates**

485 As the DLC processes applications for **NLC V5.2** and interacts with stakeholders, we
486 anticipate opportunities for minor corrections, terminology clarifications and policy
487 interpretations. To be as transparent as possible, the NLC Technical Requirements will be
488 updated as needed, and the changes will be tracked in the table below and on the [DLC](#)
489 [website](#). **Table 4** will show the corrections or clarifications and where they can be found in
490 the document.

491 **Table 4: Updates and Clarifications, Published as Needed**
